

Table of Contents

Introduction	ix
Chapter 1. Fundamentals of the Finite Element Method	1
1.1. Introduction	1
1.2. Local and global equilibrium equations.	2
1.3. Solution of the equilibrium equation by the FEM elementary steps in static.	5
1.3.1. Traction of a rectangular plate	6
1.3.2. Beam during bending	20
1.4. General formulation of the FEM (static)	30
1.4.1. Meshing	30
1.4.2. Geometric shapes of elements.	30
1.4.3. Shape functions of an element	33
1.4.4. Stress virtual work in one finite element	39
1.4.5. Virtual work of the applied forces	43
1.4.6. Assembling the elements.	46
1.4.7. Boundary and symmetry conditions	50
1.4.8. Solution	50
1.5. Reduced variables: parent space	51
1.6. Conclusion	54
Chapter 2. Modeling Structures with Beam Elements	57
2.1. Introduction	57
2.2. Beam theory.	58
2.2.1. Bernoulli-Euler beam	58

2.2.2. Timoshenko beam	68
2.3. Global axes	71
2.4. Beam examples	76
2.4.1. Rectangular cantilever beam	76
2.4.2. Discontinuities of the section and/or neutral line.	88
2.5. Complex sections	99
2.5.1. Layered composite beams: a simplified theory . . .	100
2.5.2. Beams of any section	109
2.6. Conclusion	129
Chapter 3. Stress Concentrations, Stress Singularities	131
3.1. Introduction	131
3.2. Stress concentration obtained by the FEM	133
3.2.1. General comments.	133
3.2.2. Specific comments	135
3.2.3. Common examples.	136
3.2.4. 2D stress analysis: holed plate.	137
3.2.5. Beam discontinuities	148
3.2.6. Axisymmetric example: helicopter rotor mast. . . .	151
3.2.7. 3D example	154
3.3. Stress singularities (bi-dimensional examples)	159
3.3.1. Introduction	159
3.3.2. Stress singularities	162
3.3.3. Examples	167
3.3.4. Cases of multi-material structures	180
3.4. Conclusion	185
Chapter 4. Plates	187
4.1. Introduction	187
4.2. Displacements, strains and stresses in local axes	189
4.2.1. Strains	190
4.2.2. Stresses and efforts	191
4.3. Thin plate without shear (Kirchoff's theory)	193
4.3.1. Equilibrium	193
4.3.2. Virtual work.	195
4.3.3. Finite element	196
4.4. Plate with shear (Mindlin's theory)	196

4.5. Thin plate with reduced shear (discretized Kirchoff hypothesis)	197
4.6. Comments on plate elements.	199
4.7. Plate examples	200
4.7.1. Global remarks	200
4.7.2. Examples	201
4.8. Laminated composite plates	222
4.8.1. Symmetric laminated plate	223
4.8.2. Non-symmetric laminated plate	228
4.8.3. Symmetric laminated plate with orthotropic layers	229
4.9. Conclusion	231
Chapter 5. Dynamics using the FEM	233
5.1. Introduction	233
5.2. Mass representation in the FEM	234
5.3. Dynamic equilibrium	237
5.4. Solution of the equilibrium equations: resonances.	239
5.4.1. Modal response	239
5.4.2. Damping representations	244
5.5. Time integration	246
5.5.1. Explicit central scheme	247
5.5.2. Implicit scheme: linear acceleration.	248
5.6. Modal basis	249
5.6.1. Introduction	249
5.6.2. Mode shapes	250
5.6.3. Examples	251
5.7. Conclusion	271
APPENDICES	273
Appendix 1. Determination of Beam Section Properties	275
A1.1. Mechanical characteristics of a beam section	276
A1.2. Representation of the deformation modes	289
Appendix 2. Computer Implementation of the SAA	295
A2.1. Ansys® input data	295
A2.2. File entaille.01.dat (Ansys®)	297

A2.3. File entaille.02.dat (Ansys®)	299
A2.4. File entaille_03.dat (Ansys®)	301
A2.5. File relecture_entaille.dat (Matlab®)	305
Bibliography	307
Index	313
