

Table of Contents

Preface	xiii
Chapter 1. Introduction: Pensions in Perspective	1
1.1. Pension issues	1
1.1.1. The challenge	1
1.1.2. Some figures	2
1.2. Pension scheme	7
1.2.1. Definition	7
1.2.2. The four dimensions of a pension scheme	8
1.3. Pension and risks	11
1.3.1. Demographic risks	11
1.3.2. Financial risks	12
1.3.3. Impact of the risks on various kinds of pension schemes	12
1.3.4. The time horizon of a pension scheme	13
1.4. The multi-pillar philosophy	14
Chapter 2. Classical Actuarial Theory of Pension Funding	15
2.1. General equilibrium equation of a pension scheme	15
2.1.1. Principles	15
2.1.2. The retrospective reserve	16
2.1.3. The prospective reserve	18
2.1.4. Equilibrated pension funding	18
2.1.5. Decomposition of the reserve	20
2.1.6. Classification of the methods	20
2.2. General principles of funding mechanisms for DB Schemes	21
2.3. Particular funding methods	22
2.3.1. Unit credit cost methods	23

2.3.2. Level premium methods	25
2.3.3. Aggregate cost methods	28
Chapter 3. Deterministic and Stochastic Optimal Control	31
3.1. Introduction.	31
3.2. Deterministic optimal control	31
3.2.1. Formulation of the optimal control problem	31
3.3. Necessary conditions for optimality	33
3.3.1. Bellman function	33
3.3.2. Bellman optimality equation	34
3.3.3. Hamilton-Jacobi equation	37
3.3.4. The synthesis function	38
3.3.5. Other types of optimal controls.	39
3.3.6. Example: the classical quadratic/linear control problem	41
3.4. The maximum principle	42
3.4.1. The maximum principle from the dynamic programming approach	42
3.5. Extension to the one-dimensional stochastic optimal control	45
3.5.1. Formulation of the one-dimensional stochastic optimal control problem.	46
3.5.2. Necessary conditions for one-dimensional stochastic optimality	46
3.5.3. Extension to the multi-dimensional stochastic optimal control	48
3.5.4. Dynamic programming principle.	50
3.5.5. The Hamilton-Jacobi-Bellman equation	50
3.6. Examples	52
3.6.1. Merton portfolio allocation problem.	52
Chapter 4. Defined Contribution and Defined Benefit Pension Plans	55
4.1. Introduction.	55
4.2. The defined benefit method	56
4.3. The defined contribution method	57
4.3.1. The model	57
4.3.2. The capitalization system	58
4.4. The notional defined contribution (NDC) method	58
4.4.1. Historical preliminaries	58
4.4.2. The Dini reform transformation coefficients	60
4.4.3. Theoretical preliminaries	63
4.4.4. The construction of a unitary pension present value	65
4.4.5. Numerical example and results comparison	78
4.5. Conclusions.	93

Chapter 5. Fair and Market Values and Interest Rate Stochastic Models	95
5.1. Fair value	95
5.2. Market value of financial flows	96
5.3. Yield curve	97
5.4. Yield to maturity for a financial investment and for a bond	99
5.5. Dynamic deterministic continuous time model for an instantaneous interest rate	100
5.5.1. Instantaneous interest rate	100
5.5.2. Particular cases	101
5.5.3. Yield curve associated with an instantaneous interest rate.	101
5.5.4. Examples of theoretical models	102
5.6. Stochastic continuous time dynamic model for an instantaneous interest rate.	104
5.6.1. The OUV stochastic model	105
5.6.2. The CIR model (1985).	111
5.7. Zero-coupon pricing under the assumption of no arbitrage.	114
5.7.1. Stochastic dynamics of zero-coupons	114
5.7.2. Application of the no arbitrage principle and risk premium	116
5.7.3. Partial differential equation for the structure of zero coupons.	117
5.7.4. Values of zero coupons without arbitrage opportunity for particular cases	118
5.8. Market evaluation of financial flows	130
5.9. Stochastic continuous time dynamic model for asset values	132
5.9.1. The Black-Scholes continuous time model.	132
5.9.2. The solution of the Black-Scholes-Samuelson model	132
5.9.3. Prediction	135
5.10. VaR of one asset	136
5.10.1. Motivation	136
5.10.2. Definition of VaR for one asset.	137
5.10.3. Normal distribution case.	138
5.10.4. Lognormal distribution case.	140
5.10.5. Trajectory simulation	143
5.10.6. VaR extensions: TVaR and conditional VaR.	144
Chapter 6. Risk Modeling and Solvency for Pension Funds	149
6.1. Introduction.	149
6.2. Risks in defined contribution	149
6.3. Solvency modeling for a DC pension scheme	150
6.3.1. The model	150
6.3.2. Maturity risk	151
6.3.3. Liquidity risk	156

6.3.4. Lifecycle strategy in DC schemes	163
6.3.5. Introduction of the longevity risk	166
6.4. Risks in defined benefit.	170
6.5. Solvency modeling for a DB pension scheme	171
6.5.1. The model	171
6.5.2. Maturity risk.	173
6.5.3. Liquidity risk	177
6.5.4. Introduction of longevity risk.	180
Chapter 7. Optimal Control of a Defined Benefit Pension Scheme.	181
7.1. Introduction.	181
7.2. A first discrete time approach: stochastic amortization strategy.	181
7.2.1. The problem	181
7.2.2. Stochastic evolution of the fund	182
7.2.3. Asymptotic evolution of the fund and the contribution.	184
7.2.4. Optimal amortization period	191
7.3. Optimal control of a pension fund in continuous time.	194
7.3.1. The problem	194
7.3.2. The model	195
Chapter 8. Optimal Control of a Defined Contribution Pension Scheme	207
8.1. Introduction.	207
8.2. Stochastic optimal control of annuity contracts.	208
8.2.1. The problem	208
8.2.2. The general model	209
8.2.3. Case with single contribution and no annuitization	215
8.2.4. Case with regular contributions and no annuitization.	216
8.2.5. Case with single contribution and annuitization	216
8.2.6. Case with regular premiums and annuitization	218
8.2.7. Extension: model with several risky assets	219
8.3. Stochastic optimal control of DC schemes with guarantees and under stochastic interest rates	223
8.3.1. The problem	223
8.3.2. The financial market	223
8.3.3. The pension scheme	226
8.3.4. The optimal control formulation	226
8.3.5. The solution	228

Chapter 9. Simulation Models	231
9.1. Introduction.	231
9.2. The direct method	233
9.2.1. The model	233
9.2.2. A real life example	244
9.3. The Monte Carlo models	250
9.3.1. The MAGIS model (individual as operational variable)	250
9.3.2. Time as an operational variable	251
9.4. Salary lines construction	252
9.4.1. A direct generalization of the Bernoulli process.	253
9.4.2. The salary line construction by means of the generalized Bernoulli process	257
9.4.3. A real data application	264
9.4.4. The studied cases	266
 Chapter 10. Discrete Time Semi-Markov Processes (SMP) and Reward SMP	 277
10.1. Discrete time semi-Markov processes	277
10.1.1. Purpose	277
10.1.2. DTSMP Definition	278
10.2. DTSMP numerical solutions	280
10.3. Solution of DTHSMP and DTNHSMP in the transient case: a transportation example.	284
10.3.1. Principle of the solution	284
10.3.2. Semi-Markov transportation example	286
10.4. Discrete time reward processes	294
10.4.1. Classification and notation.	294
10.4.2. Undiscounted SMRWP.	297
10.4.3. Discounted SMRWP	301
10.5. General algorithms for DTSMRWP.	304
 Chapter 11. Generalized Semi-Markov Non-homogeneous Models for Pension Funds and Manpower Management	 307
11.1. Application to pension funds evolution.	307
11.1.1. Introduction	308
11.1.2. The non-homogeneous semi-Markov pension fund model.	310
11.1.3. The reserve structure	317
11.1.4. The impact of inflation and interest variability.	319
11.1.5. Solving evolution equations	322
11.1.6. The dynamic population evolution of the pension funds	327
11.1.7. Financial equilibrium of the pension funds	330

11.1.8. Scenario and data	333
11.1.9. The usefulness of the NHSMPFM	337
11.2. Generalized non-homogeneous semi-Markov model for manpower management	338
11.2.1. Introduction	338
11.2.2. GDTNHSMP salary lines construction	339
11.2.3. GDTNHSMRWP for a reserve structure	342
11.2.4. Reserve structure with stochastic interest rate	343
11.2.5. The dynamics of population evolution.	344
11.2.6. The computation of salary cost present value.	346
11.3. Algorithms	347
11.3.1. The algorithm for the GNHSMP with a 2 time random variable.	347
11.3.2. The algorithm for the pension model	352
APPENDICES	359
Appendix 1. Basic Probabilistic Tools for Stochastic Modeling	361
A1.1. Probability space and random variables	361
A1.2. Expectation and independence	364
A1.3. Main distribution probabilities	367
A1.3.1. Binomial distribution	367
A1.3.2. Negative exponential distribution	368
A1.3.3. Normal (or Laplace Gauss) distribution	369
A1.3.4. Poisson distribution	371
A1.3.5. Lognormal distribution	372
A1.3.6. Gamma distribution	372
A1.3.7. Pareto distribution	373
A1.3.8. Uniform distribution	374
A1.3.9. Gumbel distribution	375
A1.3.10. Weibull distribution	375
A1.3.11. Multidimensional normal distribution	375
A1.4. Conditioning	378
A1.5. Stochastic processes.	386
A1.6. Martingales	390
A1.7. Brownian motion	394
Appendix 2. Itô Calculus and Diffusion Processes	397
A2.1. Problem of stochastic integration	397
A2.2. Stochastic integration of simple predictable processes and semi-martingales.	399
A2.3. General definition of the stochastic integral.	403

A2.4. Itô's formula	410
A2.4.1. Quadratic variation of a semi-martingale	410
A2.4.2. Itô's formula	412
A2.5. Stochastic integral with a standard Brownian motion as the integrator process	413
A2.5.1. Case of predictable simple processes	414
A2.5.2. Extension to general integrator processes	416
A2.6. Stochastic differentiation	417
A2.6.1. Definition	417
A2.6.2. Examples	417
A2.7. Back to the Itô's formula	419
A2.7.1. Stochastic differential of a product	419
A2.7.2. Examples	419
A2.7.3. The Itô's formula with time dependence	420
A2.7.4. Interpretation of the Itô's formula	421
A2.7.5. Other extensions of the Itô's formula	422
A2.8. Stochastic differential equations	425
A2.8.1. Existence and unicity general theorem [GIK 68]	425
A2.8.2. Solution of stochastic differential equations	429
A2.9. Diffusion processes	429
A2.10. Multidimensional diffusion processes	432
Bibliography	437
Index	449
