

## Table of Contents

<b>Preface</b> . . . . .	xix
<b>Acknowledgements</b> . . . . .	xxix
<b>PART A. CONSTITUTIVE EQUATIONS OF MATERIALS.</b> . . . . .	1
<b>Chapter 1. Elements of Anisotropic Elasticity and Complements on Previsional Calculations</b> . . . . .	3
Yvon CHEVALIER	
1.1. Constitutive equations in a linear elastic regime . . . . .	4
1.1.1. Symmetry applied to tensors $s_{ijkl}$ and $c_{ijkl}$ . . . . .	4
1.1.2. Constitutive equations under matrix form . . . . .	5
1.2. Technical elastic moduli . . . . .	7
1.2.1. Tension tests with one normal stress component $\sigma$ . . . . .	7
1.2.2. Shear test. . . . .	9
1.3. Real materials with special symmetries . . . . .	10
1.3.1. Change of reference axes . . . . .	11
1.3.2. Orthotropic materials possess two orthogonal planes of symmetry	16
1.3.3. Quasi-isotropic transverse (tetragonal) material . . . . .	19
1.3.4. Transverse isotropic materials (hexagonal system) . . . . .	20
1.3.5. Quasi-isotropic material (cubic system). . . . .	21
1.3.6. Isotropic materials . . . . .	22
1.4. Relationship between compliance $S_{ij}$ and stiffness $C_{ij}$ for orthotropic materials . . . . .	23
1.5. Useful inequalities between elastic moduli . . . . .	24
1.5.1. Orthotropic materials. . . . .	25
1.5.2. Quasi transverse isotropic materials . . . . .	26
1.5.3. Transverse isotropic, quasi-isotropic, and isotropic materials. . . . .	26

1.6. Transformation of reference axes is necessary in many circumstances . . . . .	27
1.6.1. Practical examples . . . . .	27
1.6.2. Components of stiffness and compliance after transformation . . . . .	27
1.6.3. Remarks on shear elastic moduli $G_{ij}$ ( $ij = 23, 31, 12$ ) and stiffness constants $C_{ii}$ (with $i = 4, 5, 6$ ) . . . . .	28
1.6.4. The practical consequence of a transformation of reference axes. . . . .	28
1.7. Invariants and their applications in the evaluation of elastic constants . . . . .	28
1.7.1. Elastic constants versus invariants . . . . .	32
1.7.2. Practical utilization of invariants in the evaluation of elastic constants . . . . .	35
1.8. Plane elasticity . . . . .	35
1.8.1. Expression of plane stress stiffness versus compliance matrix . . . . .	35
1.8.2. Plane stress stiffness components versus three-dimensional stiffness components. . . . .	38
1.9. Elastic previsional calculations for anisotropic composite materials . . . . .	38
1.9.1. Long fibers regularly distributed in the matrix. . . . .	39
1.9.2. Stratified composite materials . . . . .	44
1.9.3. Reinforced fabric composite materials . . . . .	46
1.10. Bibliography . . . . .	51
1.11. Appendix . . . . .	52
Appendix 1.A. Overview on methods used in previsional calculation of fiber-reinforced composite materials. . . . .	52
<b>Chapter 2. Elements of Linear Viscoelasticity . . . . .</b>	<b>57</b>
Yvon CHEVALIER	
2.1. Time delay between sinusoidal stress and strain . . . . .	59
2.2. Creep and relaxation tests . . . . .	60
2.2.1. Creep test. . . . .	60
2.2.2. Relaxation test. . . . .	61
2.2.3. Ageing and non-ageing viscoelastic materials . . . . .	62
2.2.4. Viscoelastic materials with fading memory . . . . .	63
2.3. Mathematical formulation of linear viscoelasticity . . . . .	63
2.3.1. Linear system . . . . .	63
2.3.2. Superposition (or Boltzmann's) principle. . . . .	64
2.3.3. Creep function in a functional constitutive equation . . . . .	67
2.3.4. Relaxation function in functional constitutive equations. . . . .	68
2.3.5. Properties of relaxation and creep functions . . . . .	68
2.4. Generalization of creep and relaxation functions to tridimensional constitutive equations . . . . .	71
2.4.1. Relaxation function as components in a stiffness matrix. . . . .	71

2.4.2. Creep function as components in a compliance matrix . . . . .	73
2.4.3. Some remarks on the mathematical formulation of linear viscoelastic behavior of materials. . . . .	74
2.5. Principle of correspondence and Carson-Laplace transform for transient viscoelastic problems . . . . .	74
2.5.1. Carson-Laplace's transform. . . . .	76
2.5.2. Complex moduli . . . . .	78
2.5.3. Properties of the complex relaxation and creep components matrix versus circular frequency. . . . .	80
2.6. Correspondence principle and the solution of the harmonic viscoelastic system . . . . .	82
2.7. Inter-relationship between harmonic and transient regimes . . . . .	83
2.8. Modeling of creep and relaxation functions: example. . . . .	87
2.8.1. Basic rheological cells . . . . .	88
2.8.2. General parametric modeling. . . . .	89
2.8.3. Modeling with three rheological parameters: examples . . . . .	93
2.8.4. Modeling with four rheological parameters: fractional derivative . . . . .	98
2.9. Conclusion . . . . .	100
2.10. Bibliography . . . . .	100
<b>Chapter 3. Two Useful Topics in Applied Viscoelasticity: Constitutive Equations for Viscoelastic Materials . . . . .</b>	<b>103</b>
Yvon CHEVALIER and Jean Tuong VINH	
3.1. Williams-Landel-Ferry's method . . . . .	104
3.1.1. The effect of temperature change . . . . .	104
3.1.2. Williams-Landel-Ferry's formulation . . . . .	105
3.1.3. Experimental procedure to obtain the master curve. . . . .	107
3.1.4. Examples of master curves . . . . .	108
3.1.5. Applicability of the method of reduced variables . . . . .	109
3.1.6. Utilization of another representation of complex moduli (or compliances) . . . . .	111
3.1.7. Extension of Williams-Landel-Ferry's methods to composite materials . . . . .	112
3.2. Viscoelastic time function obtained directly from a closed-form expression of complex modulus or complex compliance. . . . .	112
3.2.1. Overview of state-of-the-art in viscoelasticity and structural dynamics. . . . .	112
3.2.2. Polynomial functions of frequency used to express complex moduli . . . . .	116
3.2.3. Fractional derivatives . . . . .	124

3.2.4. Use of inverse Carson-Laplace transform to obtain a closed-form expression of transient response . . . . .	130
3.2.5. Applications . . . . .	133
3.3. Concluding remarks . . . . .	136
3.3.1. Williams-Landel-Ferry's method . . . . .	136
3.3.2. Polynomial quotient and fractional derivatives are used to mathematically express the dynamic response of viscoelastic materials . . . . .	136
3.4. Bibliography . . . . .	137
3.5. Appendices . . . . .	139
Appendix 3.A. Inversion of Laplace transform . . . . .	139
Appendix 3.B. Sutton's method for long time response . . . . .	143
<b>Chapter 4. Formulation of Equations of Motion and Overview of their Solutions by Various Methods . . . . .</b>	<b>145</b>
Jean Tuong VINH	
4.1. D'Alembert's principle . . . . .	146
4.1.1. Generalized coordinates . . . . .	146
4.1.2. Principle of virtual work . . . . .	147
4.1.3. Equation of motion by D'Alembert's principle . . . . .	148
4.2. Lagrange's equation . . . . .	149
4.2.1. System subjected to r holonomic geometric constraints . . . . .	149
4.2.2. Generalized forces . . . . .	151
4.2.3. Introduction to kinetic energy . . . . .	151
4.2.4. Lagrange's equation . . . . .	152
4.2.5. Potential function . . . . .	154
4.2.6. Lagrangian function with Rayleigh dissipation function . . . . .	155
4.3. Hamilton's principle . . . . .	157
4.4. Practical considerations concerning the choice of equations of motion and related solutions . . . . .	159
4.4.1. Boundary conditions and approximate equations of motion . . . . .	160
4.4.2. Choice of equations of motion . . . . .	160
4.4.3. The degree of approximation . . . . .	161
4.5. Three-, two- or one-dimensional equations of motion? . . . . .	162
4.5.1. Three-dimensional equations of motion . . . . .	162
4.5.2. Two- or one-dimensional equations of motion . . . . .	163
4.5.3. Wave dispersion . . . . .	163
4.6. Closed-form solutions to equations of motion . . . . .	163
4.6.1. Degree of differential equations of six or less . . . . .	163
4.6.2. Degree of differential equations exceeding six . . . . .	163
4.7. Bibliography . . . . .	164

4.8. Appendices . . . . .	165
Appendix 4.A. Equations of motion in elastic medium deduced from Love's variational principle. . . . .	165
Appendix 4.B. Lagrange's equations of motion deduced from Hamilton's principle . . . . .	167
<b>PART B. ROD VIBRATIONS . . . . .</b>	<b>173</b>
<b>Chapter 5. Torsional Vibration of Rods . . . . .</b>	<b>175</b>
Yvon CHEVALIER, Michel NUGUES and James ONOBIONO	
5.1. Introduction. . . . .	175
5.1.1. Short bibliography of the torsion problem . . . . .	176
5.1.2. Survey of solving methods for torsion problems . . . . .	176
5.1.3. Extension of equations of motion to a larger frequency range . . . . .	179
5.2. Static torsion of an anisotropic beam with rectangular section without bending – Saint Venant, Lekhnitskii's formulation . . . . .	180
5.2.1. Airy's function and field of displacement $\psi$ . . . . .	181
5.2.2. Solution of equation [5.10] with Airy's function . . . . .	184
5.2.3. Expressions of torsion moment $M_t$ versus torsion angle $\alpha$ and stiffness $C_T$ . . . . .	186
5.2.4. Approximate formulae for $M_T$ and $C_T$ . . . . .	189
5.2.5. Dynamic torsion of a rod with rectangular section using the elementary equation of motion. . . . .	189
5.2.6. Pure dynamic torsion of a rod with rectangular cross-section using first-degree approximation . . . . .	194
5.3. Torsional vibration of a rod with finite length . . . . .	199
5.3.1. Closed-form solution of $\theta(z, t)$ . . . . .	200
5.3.2. Evaluation of spatial solution $\Theta(z)$ . . . . .	202
5.3.3. Evaluation of coefficients $\theta(z, t)$ and $\zeta(z, t)$ . . . . .	203
5.4. Simplified boundary conditions associated with higher approximation equations of motion [5.49]. . . . .	204
5.5. Higher approximation equations of motion . . . . .	205
5.5.1. Slenderness . . . . .	205
5.5.2. Ratio $E/G_{ij}$ . . . . .	205
5.5.3. Flatness ratio $s = \text{width/thickness} = b/h$ . . . . .	207
5.5.4. Saint Venant's theory versus higher approximation theory . . . . .	207
5.6. Extension of Engström's theory to the anisotropic theory of dynamic torsion of a rod with rectangular cross-section. . . . .	207
5.7. Equations of motion. . . . .	212
5.7.1. Matricial form . . . . .	212
5.7.2. Decoupled equation of motion and correcting coefficient . . . . .	214

5.8. Torsion wave dispersion . . . . .	215
5.8.1. Expressions of angular displacement $\alpha(z, t)$ and axial displacement $\psi(z, t)$ . . . . .	215
5.8.2. Phase velocity for the two first elastodynamic modes . . . . .	217
5.9. Presentation of dispersion curves . . . . .	219
5.9.1. Isotropic rod with circular section . . . . .	219
5.9.2. Isotropic steel rod with rectangular section. . . . .	219
5.9.3. Anisotropic composite rods . . . . .	219
5.9.4. Some remarks . . . . .	223
5.9.5. Practical remark . . . . .	225
5.9.6. Comparison with other theories (Barr and Engström) . . . . .	225
5.10. Torsion vibrations of an off-axis anisotropic rod . . . . .	225
5.10.1. Displacement field . . . . .	226
5.10.2. Equations of motion . . . . .	229
5.10.3. Eigenfrequency equations of motion. . . . .	229
5.10.4. Solutions of decoupled equations. . . . .	233
5.10.5. For a very long rod . . . . .	234
5.11. Dispersion of deviated torsional waves in off-axis anisotropic rods with rectangular cross-section . . . . .	235
5.12. Dispersion curve of torsional phase velocities of an off-axis anisotropic rod. . . . .	240
5.13. Concluding remarks . . . . .	241
5.13.1. Characterization of shear moduli and non-diagonal coefficients of a compliance matrix . . . . .	241
5.13.2. Dispersion of torsional phase velocity . . . . .	241
5.13.3. Saint Venant's warping theory . . . . .	241
5.13.4. A more elaborate warping theory. . . . .	242
5.13.5. Dispersion of torsional phase velocity . . . . .	242
5.13.6. Nogue's theory . . . . .	242
5.13.7. Dispersion of phase and group velocities . . . . .	242
5.14. Bibliography . . . . .	242
5.15. Table of symbols . . . . .	244
5.16. Appendices . . . . .	246
Appendix 5.A. Approximate formulae for torsion stiffness . . . . .	246
Appendix 5.B. Equations of torsional motion obtained from Hamilton's variational principle . . . . .	250
Appendix 5.C. Extension of Barr's correcting coefficient in equations of motion . . . . .	257
Appendix 5.D. Details on coefficient calculations for $\theta(z, t)$ and $\zeta(z, t)$ . . . . .	258
Appendix 5.E. A simpler solution to the problem analyzed in Appendix 5.D . . . . .	263

Appendix 5.F. Onobiono's and Zienkiewics' solutions using finite element method for warping function $\phi$ . . . . .	265
Appendix 5.G. Formulation of equations of motion for an off-axis anisotropic rod submitted to coupled torsion and bending vibrations . . . . .	273
Appendix 5.H. Relative group velocity versus relative wave number . . . . .	279
<b>Chapter 6. Bending Vibration of a Rod.</b> . . . . .	291
Dominique LE NIZHERY	
6.1. Introduction. . . . .	291
6.1.1. Short bibliography of dynamic bending of a beam . . . . .	292
6.2. Bending vibration of straight beam by elementary theory . . . . .	293
6.2.1. Bernoulli-Euler's equation of motion . . . . .	293
6.2.2. Solutions of Bernoulli-Euler's equations . . . . .	296
6.3. Higher approximation theory of bending vibration . . . . .	299
6.3.1. Formulation of the equations of motion. . . . .	299
6.3.2. Coupled equations of motion . . . . .	302
6.3.3. Decoupled equation of motion . . . . .	303
6.3.4. Solution to the practical problem. . . . .	305
6.3.5. Stationary bending vibration . . . . .	305
6.3.6. Non-dimensional equation of motion . . . . .	305
6.3.7. Equation of motion with reduced variables. . . . .	306
6.3.8. Expression of flexural displacement and shear $\varphi$ . . . . .	307
6.3.9. Coefficient calculations . . . . .	308
6.3.10. Evaluation of Young's modulus by solution of Timoshenko's equation . . . . .	309
6.3.11. Dispersion curves related to various theories of bending waves in a rod . . . . .	311
6.3.12. Influence of rotational inertia and transverse shear . . . . .	312
6.4. Bending vibration of an off-axis anisotropic rod . . . . .	313
6.4.1. Preliminary considerations . . . . .	313
6.4.2. Flexural vibration of an off-axis rod. . . . .	313
6.4.3. Equations of motion . . . . .	314
6.4.4. Reduced variables and characteristic frequency equations for stationary waves . . . . .	317
6.4.5. Computer program using trial and error method to evaluate Poisson's number. . . . .	324
6.5. Concluding remarks. . . . .	324
6.5.1. Choice of equations of motion . . . . .	324
6.5.2. Test sample slenderness and influence of shear effect . . . . .	325
6.5.3. Strong influence of shear effect for composite materials: accuracy of Young's modulus and non-diagonal technical modulus evaluation. . . . .	326

6.5.4. Comments on computational effort to evaluate Young's modulus for off-axis samples . . . . .	326
6.6. Bibliography . . . . .	326
6.7. Table of symbols. . . . .	327
6.8. Appendices . . . . .	328
Appendix 6.A. Timoshenko's correcting coefficients for anisotropic and isotropic materials. . . . .	328
Appendix 6.B. Correcting coefficient using Mindlin's method. . . . .	333
Appendix 6.C. Dispersion curves for various equations of motion. . . . .	334
Appendix 6.D. Change of reference axes and elastic coefficients for an anisotropic rod . . . . .	337
<b>Chapter 7. Longitudinal Vibration of a Rod . . . . .</b>	<b>339</b>
Yvon CHEVALIER and Maurice TOURATIER	
7.1. Presentation. . . . .	339
7.1.1. Elementary equation of motion. . . . .	340
7.1.2. Boundary conditions . . . . .	342
7.2. Bishop's equations of motion . . . . .	343
7.2.1. Isotropic material . . . . .	343
7.2.2. Transversely isotropic material. . . . .	343
7.2.3. Longitudinal wave dispersion. . . . .	344
7.3. Improved Bishop's equation of motion . . . . .	345
7.4. Bishop's equation for orthotropic materials. . . . .	346
7.5. Eigenfrequency equations for a free-free rod . . . . .	346
7.5.1. Harmonic solution for dimensionless Bishop's equation. . . . .	346
7.5.2. Boundary conditions and eigenvalue equations . . . . .	348
7.6. Touratier's equations of motion of longitudinal waves . . . . .	350
7.6.1. General considerations. . . . .	350
7.6.2. Dispersion curves according to various theories. . . . .	350
7.6.3. Displacement field and boundary conditions. . . . .	353
7.6.4. Strain and stress components . . . . .	357
7.6.5. Energy functionals and Hamilton's principle . . . . .	361
7.6.6. Equations of motion . . . . .	366
7.6.7. Boundary equations . . . . .	367
7.7. Wave dispersion relationships. . . . .	367
7.7.1. Phase velocity in composite materials. . . . .	369
7.7.2. Extensional waves in an anisotropic composite rod with rectangular cross-section – dispersion curves . . . . .	372
7.7.3. Natural boundary conditions . . . . .	385
7.7.4. Various types of solutions for the equations of motion. . . . .	386

7.8. Short rod and boundary conditions . . . . .	393
7.8.1. Elementary theory . . . . .	393
7.8.2. Boundary conditions . . . . .	394
7.9. Concluding remarks about Touratier's theory . . . . .	395
7.10. Bibliography . . . . .	396
7.11. List of symbols . . . . .	397
7.12. Appendices . . . . .	399
Appendix 7.A. an outline of some studies on longitudinal vibration of rods with rectangular cross-section . . . . .	399
Appendix 7.B. Formulation of Bishop's equation by Hamilton's principle by Rao and Rao . . . . .	401
Appendix 7.C. Dimensionless Bishop's equations of motion and dimensionless boundary conditions . . . . .	405
Appendix 7.D. Touratier's equations of motion by variational calculus . . . . .	408
Appendix 7.E. Calculation of correcting factor $q$ ( $C_{ijkl}$ ) . . . . .	409
Appendix 7.F. Stationarity of functional $\bar{J}$ and boundary equations. . . . .	419
Appendix 7.G. On the possible solutions of eigenvalue equations. . . . .	419
<b>Chapter 8. Very Low Frequency Vibration of a Rod by Le Rolland-Sorin's Double Pendulum . . . . .</b>	<b>425</b>
Mostefa ARCHI and Jean-Baptiste CASIMIR	
8.1. Introduction. . . . .	425
8.1.1. Frequency range . . . . .	425
8.1.2. Simplicity and ease. . . . .	426
8.2. Short bibliography. . . . .	427
8.3. Flexural vibrations of a rod using coupled pendulums . . . . .	427
8.3.1. Lagrange equations of motion . . . . .	428
8.3.2. Eigenvalue equation . . . . .	430
8.3.3. Solutions for pendulum oscillations . . . . .	431
8.3.4. Relationship between beating period and sample stiffness $k$ . . . . .	431
8.4. Torsional vibration of a beam by double pendulum . . . . .	434
8.4.1. Equations of torsional motions . . . . .	434
8.5. Complex compliance coefficient of viscoelastic materials . . . . .	436
8.5.1. General consideration . . . . .	436
8.5.2. Expression of $(\omega_1 - \omega_2)$ . . . . .	439
8.5.3. Utilization of correspondence principle to obtain complex sample rigidity . . . . .	441
8.6. Elastic stiffness of an off-axis rod . . . . .	443
8.6.1. Elementary equations of motion . . . . .	444
8.6.2. Higher approximation equations of motion. . . . .	448

8.7. Bibliography . . . . .	449
8.8. List of symbols . . . . .	450
8.9. Appendices . . . . .	452
Appendix 8.A. Closed-form expression of $\theta_1$ or $\theta_2$ oscillation angles of the pendulums and practical considerations . . . . .	452
Appendix 8.B. Influence of the highest eigenfrequency $\omega_3$ on the pendulum oscillations in the expression of $\theta_1(t)$ . . . . .	457
Appendix 8.C. Coefficients $a$ of compliance matrix after a change of axes for transverse isotropic material . . . . .	458
Appendix 8.D. Mathematical formulation of the simultaneous bending and torsion of an off-axis rectangular rod . . . . .	460
Appendix 8.E. Details on calculations of $s_{35}$ and $v_{13}$ of transverse isotropic materials . . . . .	486
<b>Chapter 9. Vibrations of a Ring and Hollow Cylinder . . . . .</b>	<b>493</b>
Jean Tuong VINH	
9.1. Introduction . . . . .	493
9.2. Equations of motion of a circular ring with rectangular cross-section . . . . .	494
9.2.1. Generalized displacement and force . . . . .	494
9.2.2. Bending equations . . . . .	495
9.2.3. Strain components . . . . .	496
9.2.4. Force components . . . . .	497
9.2.5. Equations of motion . . . . .	498
9.2.6. Eigenvalue equations . . . . .	498
9.2.7. Solution of characteristics equation . . . . .	499
9.2.8. Equations of motion of the ring submitted to in plane forced vibrations . . . . .	500
9.2.9. Expression of Young's modulus versus $Q$ . . . . .	501
9.3. Bibliography . . . . .	502
9.4. Appendices . . . . .	503
Appendix 9.A. Expression $u(\theta)$ in the three subintervals delimited by the roots $\lambda$ of equation [9.33] . . . . .	503
<b>Chapter 10. Characterization of Isotropic and Anisotropic Materials by Progressive Ultrasonic Waves. . . . .</b>	<b>513</b>
Patrick GARCEAU	
10.1. Presentation of the method . . . . .	513
10.1.1. Use of ultrasonic waves . . . . .	513
10.1.2. Practical considerations of ultrasonic waves . . . . .	514
10.2. Propagation of elastic waves in an infinite medium . . . . .	515

10.3. Progressive plane waves . . . . .	516
10.3.1. Christoffel tensor . . . . .	517
10.3.2. Christoffel's equation. . . . .	517
10.3.3. Eigenvalues of $\Gamma_{ik}$ are real . . . . .	518
10.3.4. Eigenvectors of $\Gamma_{ik}$ are mutually orthogonal . . . . .	518
10.4. Polarization of three kinds of waves . . . . .	518
10.4.1. Longitudinal wave . . . . .	518
10.4.2. Transverse or shear wave . . . . .	518
10.4.3. Quasi transverse (QT) wave . . . . .	519
10.5. Propagation in privileged directions and phase velocity calculations . . . . .	519
10.5.1. Wave propagation along material symmetry axes . . . . .	520
10.5.2. Elastic constants obtained with $\vec{p}$ colinear with one of the three material directions of symmetry . . . . .	525
10.5.3. Wave propagation along a non-privileged direction. . . . .	525
10.6. Slowness surface and wave propagation through a separation surface . . . . .	528
10.6.1. Slowness surface representation . . . . .	529
10.6.2. Slowness surfaces for transverse isotropic composite material . . . . .	533
10.7. Propagation of an elastic wave through an anisotropic blade with two parallel faces . . . . .	535
10.7.1. Direct transducer couplings with sample . . . . .	536
10.7.2. Water immersion bench . . . . .	537
10.8. Concluding remarks . . . . .	542
10.9. Bibliography . . . . .	543
10.10. List of Symbols . . . . .	544
10.11. Appendices . . . . .	546
Appendix 10.A. Energy velocity, group velocity, Poynting vector . . . . .	546
Appendix 10.B. Slowness surface and energy velocity . . . . .	553
<b>Chapter 11. Viscoelastic Moduli of Materials Deduced from Harmonic Responses of Beams . . . . .</b>	<b>555</b>
Tibi BEDA, Christine ESTEOULE, Mohamed SOULA and Jean Tuong VINH	
11.1. Introduction . . . . .	555
11.1.1. Trial and error method . . . . .	555
11.1.2. Are wave dispersion phenomena to be taken into account or not? . . . . .	556
11.1.3. Williams-Landel-Ferry's method. . . . .	556
11.1.4. Validity of elementary equations of motion . . . . .	556
11.1.5. Choice of equations of motion without recourse to Williams-Landel-Ferry's method . . . . .	556
11.2. Guidelines for practitioners. . . . .	557
11.2.1. Viscoelastic complex moduli and frequency range . . . . .	557

11.3. Solution of a viscoelastic problem using the principle of correspondence . . . . .	558
11.3.1. First step: elastic solution . . . . .	559
11.3.2. Second step: estimation of dispersion curves . . . . .	560
11.3.3. Searching for a solution to viscoelastic moduli using characteristic functions . . . . .	561
11.4. Viscoelastic solution of equation of motions . . . . .	564
11.4.1. Experimental dynamic responses must be available . . . . .	564
11.4.2. Elementary equations of motion and closed-form expression for the transmissibility function for an extensional wave . . . . .	566
11.4.3. Torsional vibration of a viscoelastic rod . . . . .	572
11.4.4. Bending vibration of a viscoelastic rod . . . . .	575
11.5. Viscoelastic moduli using equations of higher approximation degree . . . . .	579
11.5.1. Inertia and shear effects . . . . .	580
11.5.2. Torsional vibration . . . . .	581
11.5.3. Bending vibration of a rod (higher order approximation) . . . . .	582
11.6. Bibliography . . . . .	588
11.7. Appendices . . . . .	589
Appendix 11.A. Transmissibility function of a rod submitted to longitudinal vibration (elementary equation of motion) . . . . .	589
Appendix 11.B. Newton-Raphson's method applied to a couple of functions of two real variables $\beta_1$ and $\beta_2$ components of $\beta$ . . . . .	590
Appendix 11.C. Transmissibility function of a clamped-free Bernoulli's rod submitted to bending vibration . . . . .	591
Appendix 11.D. Complex transmissibility function of a clamped-free Bernoulli's rod and its decomposition into two functions of real variables $\beta_1, \beta_2$ . . . . .	593
Appendix 11.E. Eigenvalue equation of clamped-free Timoshenko's rod . . . . .	594
Appendix 11.F. Transmissibility function of clamped-free Timoshenko's rod . . . . .	595
<b>Chapter 12. Continuous Element Method Utilized as a Solution to Inverse Problems in Elasticity and Viscoelasticity . . . . .</b>	<b>599</b>
Jean-Baptiste CASIMIR	
12.1. Introduction . . . . .	599
12.2. Overview of the continuous element method . . . . .	601
12.2.1. Equilibrium equations and the force-displacement relationship . . . . .	601
12.2.2. Explicit continuous element . . . . .	603
12.2.3. State vector and dynamic transfer matrix . . . . .	605

12.2.4. Transfer matrix and dynamic stiffness presented in suitable form for matrix calculation . . . . .	606
12.2.5. Eigenvalues and eigenvectors of dynamic stiffness. . . . .	607
12.3. Boundary conditions and their implications in the transfer matrix. . .	608
12.4. Extensional vibration of straight beams (elementary theory) . . . . .	609
12.5. The direct problem of beams submitted to bending vibration. . . . .	612
12.5.1. Euler-Bernoulli's transfer matrix and dynamic stiffness matrix. . .	612
12.5.2. Numerical simulation for a free-free Bernoulli's rod . . . . .	614
12.5.3. Bending vibration of a free-free Timoshenko's beam. . . . .	614
12.5.4. Dynamic transfer matrix for Timoshenko's beam . . . . .	616
12.6. Successive calculation steps to obtain a transfer matrix and simple displacement transfer function . . . . .	620
12.6.1. Eigenvalue calculations . . . . .	620
12.6.2. Eigenvector calculation of $[D\omega]$ . . . . .	622
12.7. Continuous element method adapted for solving an inverse problem in elasticity and viscoelasticity. . . . .	622
12.8. Bibliography . . . . .	624
12.9. Appendices . . . . .	624
Appendix 12.A. Wavenumbers $\beta_1, \beta_2$ deduced from Timoshenko's equation . . . . .	624
<b>List of Authors</b> . . . . .	629
<b>Index</b> . . . . .	631
