Table of Contents

Introduction xiii
Bernard DE FORNEL and Jean-Paul LOUIS

PART I. MEASURES AND IDENTIFICATIONS 1

Chapter 1. Identification of Induction Motor in Sinusoidal Mode 3
Edouard LAROCHE and Jean-Paul LOUIS

1.1. Introduction 3
1.2. The models 4
1.2.1. Dynamic model of the induction machine 4
1.2.2. Establishment of the four parameter models 5
1.2.3. Magnetic circuit saturation 9
1.2.4. Iron losses 11
1.2.5. Sinusoidal mode 11
1.2.6. Summary of the different models 13
1.2.7. Measurements 15
1.2.8. Use of the nameplates 16
1.3. Traditional methods from a limited number of measurements 17
1.3.1. Measurement of stator resistance 17
1.3.2. Total rotor leakage model 18
1.3.3. Total stator leakage models 21
1.3.4. Saturation characteristic 21
1.3.5. Experimental results 22
1.4. Estimation by minimization of a criteria based on admittance 24
1.4.1. Estimation of parameters by minimization of a criterion 24
1.4.2. Choice of criterion 25
1.4.3. Implementation 26
1.4.4. Analysis of estimation errors 27
1.4.5. Experimental results 33

1.4.6. Optimal experiment design 33
1.4.7. Conclusion on the method. 35
1.5. Linear estimation 36
1.5.1. Principle 36
1.5.2. Case of the five parameter model 37
1.5.3. Study of precision 38
1.5.4. Experimental results 41
1.5.5. Conclusion on the "linearizing" method 43
1.6. Conclusion 44
1.7. Appendix 45
1.7.1. Expression of sensitivities. 45
1.7.2. Characteristics of the machines used 47
1.8. Bibliography 47

Chapter 2. Modeling and Parameter Determination of the Saturated Synchronous Machine 49
Ernest MATAGNE and Emmanuel DE JAEGER

2.1. Modeling of the synchronous machine: general theory 49
2.1.1. Description of the machine studied and general modeling hypotheses. 49
2.1.2. Fundamental circuit laws for the study of electrical machines . . . 52
2.1.3. Equations of the machine in abc variables 54
2.1.4. Concordia transformation: equations of the machine in 0αβ variables 58
2.1.5. Park transformation: equations of the machine in 0dq variables . . 66
2.1.6. Connection between the machine and a three-phase link. 72
2.1.7. Reduction of rotor circuits to the stator 72
2.1.8. Relative units (per-unit) 80
2.2. Classical models and tests 83
2.2.1. The synchronous non-saturated machine 83
2.2.2. General classical tests 86
2.2.3. Potier Method 96
2.3. Advanced models: the synchronous machine in saturated mode. 100
2.3.1. Elements of the von der Embse theory of saturated electrical machines: inductive circuits in the presence of magnetic saturation 100
2.3.2. General study of magnetic coupling in the presence of saturation . 101
2.3.3. Implementation of the model 113
2.4. Bibliography 116

Chapter 3. Real-Time Estimation of the Induction Machine Parameters . 119
Luc LORON

3.1. Introduction. 119

3.2. Objectives of parameter estimation 121
3.2.1. On control 121
3.2.2. Diagnosis 123
3.3. Fundamental problems 124
3.3.1. Identifiability, parameterization, and validation of the model . . . 125
3.3.2. Choice of the sampling period and digital problems 127
3.3.3. Monitoring and information analysis 131
3.4. Least square methods 138
3.4.1. Principle of least squares and instrumental variables 138
3.4.2. Application to the induction motor 141
3.5. Extended Kalman filter 146
3.5.1. Principle 147
3.5.2. Tuning of Q and R matrices 149
3.5.3. Application to the induction motor 150
3.6. Extended Luenberger observer 158
3.6.1. Principle 158
3.6.2. Estimation of induction machine velocity 161
3.7. Conclusion 168
3.8. Appendix: machine characteristics 169
3.9. Bibliography 169

PART II. OBSERVER EXAMPLES 175

Chapter 4. Linear Estimators and Observers for the Induction Machine (IM) 177
Maria PIETRZAK-DAVID, Bernard DE FORNEL and Alain BOUSCAYROL

4.1. Introduction 177
4.2. Estimation models for the induction machine 178
4.2.1. Park model for the induction machine 178
4.2.2. Different state models for flux estimation 181
4.2.3. Different study reference frames for flux estimation 184
4.3. Flux estimation 186
4.3.1. Introduction 186
4.3.2. Stator flux estimator 187
4.3.3. Rotor flux estimator 189
4.4. Flux observation 190
4.4.1. Full order deterministic observer 190
4.5. Linear stochastic observers—Kalman–Bucy filters 198
4.5.1. Introduction 198
4.5.2. Kalman–Bucy filter model 199
4.5.3. Convergence of the Kalman filter 201
4.5.4. Simulation results and experimental results 204
4.6. Separate estimation and observation structures of the rotation speed . 210

4.6.1. Introduction 210
4.6.2. General principles 210
4.6.3. Speed estimation and observation methods 211
4.7. Adaptive observer. 223
4.7.1. Introduction 223
4.7.2. Determination of observer gains. 227
4.7.3. Speed adaptation law 228
4.7.4. Simulation results and experimental results 231
4.8. Variable structure mechanical observer (VSMO) 234
4.8.1. Basic principle 234
4.8.2. Construction of the VSMO 237
4.8.3. Determination of variable structure observer gains 238
4.8.4. Presentation of observer performances 239
4.8.5. Low-speed operation 244
4.8.6. Robustness in relation to parametric variations 246
4.9. Conclusion 248
4.10. Bibliography 249

Chapter 5. Decomposition of a Determinist Flux Observer for the Induction Machine: Cartesian and Reduced Order Structures . . 251
Alain BOUSCAYROL, Maria PIETRZAK-DAVID and Bernard DE FORNEL

5.1. Introduction 251
5.2. Estimation models for the induction machine 252
5.2.1. Park model of the induction machine. 252
5.2.2. State models for Cartesian and reduced observers 255
5.2.3. Determination of the flux in the reference used by the control. . . 258
5.3. Cartesian observers 260
5.3.1. Principle and structure of Cartesian observers 260
5.3.2. Different Cartesian observers 262
5.3.3. Synthesis of the Cartesian observer linked to stator and rotor fluxes. 264
5.3.4. Discretization of the Cartesian observer linked to stator and rotor fluxes. 267
5.3.5. Validation of the Cartesian observer for stator and rotor fluxes . . 269
5.3.6. Assessment on Cartesian observers 271
5.4. Reduced order observers. 271
5.4.1. Principle and structure of reduced order observers. 272
5.4.2. Different reduced order observers. 275
5.4.3. Synthesis of the reduced order rotor flux observer 276
5.4.4. Discretization of the reduced order rotor flux observer 279
5.4.5. Validation of the reduced order rotor flux observer 279
5.4.6. Assessment on reduced order observers 280
5.5. Conclusion on Cartesian and reduced order observers 281

5.6. Appendix: parameters of the study induction machine 281
5.7. Bibliography 281

Chapter 6. Observer Gain Determination Based on Parameter Sensitivity Analysis 285
Benoît ROBYNS

6.1. Introduction 285
6.2. Flux observers 286
6.2.1. Rotor flux estimator 286
6.2.2. Reduced order flux observer 288
6.2.3. Full order flux observer 290
6.2.4. Choice of observer gains 291
6.2.5. Choice of the reference frame 292
6.3. Analysis method of the parametric sensitivity 293
6.3.1. Flux amplitude and phase error estimation 293
6.3.2. Influence of the magnetic saturation 296
6.3.3. Calculation algorithm of errors in the estimated flux 297
6.3.4. Variations of the stator current used 297
6.4. Choice of observer gains 298
6.4.1. Pole placement and parametric sensitivity 298
6.4.2. Optimal observer 300
6.5. Reduced order flux observer 301
6.5.1. Control strategy 301
6.5.2. Error in flux orientation and amplitude 302
6.5.3. Theoretical results 304
6.5.4. Experimental results 307
6.6. Full order flux observer 310
6.6.1. Control strategy 310
6.6.2. Error in flux orientation and amplitude 310
6.6.3. Theoretical results 311
6.6.4. Experimental results 315
6.7. Conclusion 316
6.8. Appendix: parameters of the squirrel-cage induction machine 319
6.9. Bibliography 319

Chapter 7. Observation of the Load Torque of an Electrical Machine . . . 321
Maurice FADEL and Bernard DE FORNEL

7.1. Introduction 321
7.2. Characterization of a load torque relative to an axis of rotation 322
7.2.1. Introduction 322
7.2.2. Disruptions of the electrical machine torque 323
7.2.3. Load torque disruptions by modification of contact actions 326

7.3. Modal control of the actuator with load torque observation 330
7.3.1. Introduction 330
7.3.2. State representation of the actuator 331
7.3.3. Analysis of controllability and observability 333
7.3.4. Control law by state feedback 334
7.4. Observation of load torque 342
7.4.1. Introduction 342
7.4.2. Observer with integration in the loop 343
7.4.3. Complete order observer 351
7.4.4. Reduced order two observer based on the measure of position . . 360
7.4.5. Reduced order one observer based on speed measure 370
7.4.6. Comparative study of different types of observers 375
7.5. Robustness of control law by state feedback with observation of the resistant torque 377
7.5.1. Introduction 377
7.5.2. Context of the study 377
7.5.3. Robustness of actuator position 379
7.5.4. Robustness of actuator rotation speed 382
7.5.5. Conclusions 384
7.6. Experimental results 386
7.6.1. Introduction 386
7.6.2. Results of modal control with pump torque observer 387
7.6.3. Non-linear friction influence 395
7.7. Conclusion 399
7.8. Bibliography 401

Chapter 8. Observation of the Rotor Position to Control the Synchronous Machine without Mechanical Sensor 405
Stéphane CAUX and Maurice FADEL

8.1. State of the art 405
8.2. Reconstruction of the low-resolution position 409
8.2.1. Equivalent electromotive force measure 410
8.2.2. Reconstruction of the sum of electromotive forces using the machine neutral 411
8.2.3. Use of the extended Park reference 412
8.2.4. Use of a two-phase reference 413
8.3. Exact reconstruction by redundant observer 414
8.3.1. Principle and implementation of analytical redundancy 415
8.3.2. Adjustment of correction gains 419
8.3.3. Sensitivity and robustness 430
8.3.4. Experimental results 434

8.4. Exact reconstruction by Kalman filter 436
8.4.1. Overview 436
8.4.2. Using the Kalman filter for the synchronous machine without mechanical sensor 440
8.4.3. Application for the synchronous machine 442
8.4.4. Gain adjustment 444
8.4.5. Assessment on the adjustment of Kalman filter factors 450
8.5. Comparison of reconstructions by Kalman filter or analytical redundancy observer 451
8.5.1. Influence of rating 452
8.5.2. Influence of the initial rotor position 453
8.5.3. Sensitivity to electric parameters 453
8.5.4. Influence and management of load torque 455
8.6. Bibliography 458
