|---|----|
| Preface | 13 |
| Chapter 1. Vibrations of Continuous Elastic Solid Media | 17 |
| 1.1. Objective of the chapter | 17 |
| 1.2. Equations of motion and boundary conditions of continuous media | 18 |
| 1.2.1. Description of the movement of continuous media | 18 |
| 1.2.2. Law of conservation | 21 |
| 1.2.3. Conservation of mass | 23 |
| 1.2.4. Conservation of momentum. | 23 |
| 1.2.5. Conservation of energy | 25 |
| 1.2.6. Boundary conditions | 26 |
| 1.3. Study of the vibrations: small movements around a position of static, stable equilibrium. | 28 |
| 1.3.1. Linearization around a configuration of reference. | 28 |
| 1.3.2. Elastic solid continuous media | 32 |
| 1.3.3. Summary of the problem of small movements of an elastic continuous medium in adiabatic mode | 33 |
| 1.3.4. Position of static equilibrium of an elastic solid medium | 34 |
| 1.3.5. Vibrations of elastic solid media | 35 |
| 1.3.6. Boundary conditions | 37 |
| 1.3.7. Vibrations equations | 38 |
| 1.3.8. Notes on the initial conditions of the problem of vibrations. | 39 |
| 1.3.9. Formulation in displacement | 40 |
| 1.3.10. Vibration of viscoelastic solid media | 40 |
| 1.4. Conclusion | 44 |

| | |
|--|-----|
| Chapter 2. Variational Formulation for Vibrations of Elastic Continuous Media | 45 |
| 2.1. Objective of the chapter | 45 |
| 2.2. Concept of the functional, bases of the variational method | 46 |
| 2.2.1. The problem | 46 |
| 2.2.2. Fundamental lemma | 46 |
| 2.2.3. Basis of variational formulation | 47 |
| 2.2.4. Directional derivative | 50 |
| 2.2.5. Extremum of a functional calculus | 55 |
| 2.3. Reissner's functional | 56 |
| 2.3.1. Basic functional | 56 |
| 2.3.2. Some particular cases of boundary conditions | 59 |
| 2.3.3. Case of boundary conditions effects of rigidity and mass | 60 |
| 2.4. Hamilton's functional | 61 |
| 2.4.1. The basic functional | 61 |
| 2.4.2. Some particular cases of boundary conditions | 62 |
| 2.5. Approximate solutions | 63 |
| 2.6. Euler equations associated to the extremum of a functional | 64 |
| 2.6.1. Introduction and first example | 64 |
| 2.6.2. Second example: vibrations of plates | 68 |
| 2.6.3. Some results | 72 |
| 2.7. Conclusion | 75 |
| | |
| Chapter 3. Equation of Motion for Beams | 77 |
| 3.1. Objective of the chapter | 77 |
| 3.2. Hypotheses of condensation of straight beams | 78 |
| 3.3. Equations of longitudinal vibrations of straight beams | 80 |
| 3.3.1. Basic equations with mixed variables | 80 |
| 3.3.2. Equations with displacement variables | 85 |
| 3.3.3. Equations with displacement variables obtained by Hamilton's functional | 86 |
| 3.4. Equations of vibrations of torsion of straight beams | 89 |
| 3.4.1. Basic equations with mixed variables | 89 |
| 3.4.2. Equation with displacements | 91 |
| 3.5. Equations of bending vibrations of straight beams | 93 |
| 3.5.1. Basic equations with mixed variables: Timoshenko's beam | 93 |
| 3.5.2. Equations with displacement variables: Timoshenko's beam | 97 |
| 3.5.3. Basic equations with mixed variables: Euler-Bernoulli beam | 101 |
| 3.5.4. Equations of the Euler-Bernoulli beam with displacement variable | 102 |
| 3.6. Complex vibratory movements: sandwich beam with a flexible inside | 104 |
| 3.7. Conclusion | 109 |

| | |
|--|-----|
| Chapter 4. Equation of Vibration for Plates | 111 |
| 4.1. Objective of the chapter | 111 |
| 4.2. Thin plate hypotheses | 112 |
| 4.2.1. General procedure | 112 |
| 4.2.2. In plane vibrations | 112 |
| 4.2.3. Transverse vibrations: Mindlin's hypotheses | 113 |
| 4.2.4. Transverse vibrations: Love-Kirchhoff hypotheses | 114 |
| 4.2.5. Plates which are non-homogenous in thickness | 115 |
| 4.3. Equations of motion and boundary conditions of in plane vibrations | 116 |
| 4.4. Equations of motion and boundary conditions of transverse vibrations | 121 |
| 4.4.1. Mindlin's hypotheses: equations with mixed variables | 121 |
| 4.4.2. Mindlin's hypotheses: equations with displacement variables | 123 |
| 4.4.3. Love-Kirchhoff hypotheses: equations with mixed variables | 124 |
| 4.4.4. Love-Kirchhoff hypotheses: equations with displacement variables | 127 |
| 4.4.5. Love-Kirchhoff hypotheses: equations with displacement variables obtained using Hamilton's functional | 129 |
| 4.4.6. Some comments on the formulations of transverse vibrations | 130 |
| 4.5. Coupled movements. | 130 |
| 4.6. Equations with polar co-ordinates | 133 |
| 4.6.1. Basic relations. | 133 |
| 4.6.2. Love-Kirchhoff equations of the transverse vibrations of plates | 135 |
| 4.7. Conclusion | 138 |
| | |
| Chapter 5. Vibratory Phenomena Described by the Wave Equation | 139 |
| 5.1. Introduction. | 139 |
| 5.2. Wave equation: presentation of the problem and uniqueness of the solution. | 140 |
| 5.2.1. The wave equation | 140 |
| 5.2.2. Equation of energy and uniqueness of the solution | 142 |
| 5.3. Resolution of the wave equation by the method of propagation (d'Alembert's methodology). | 145 |
| 5.3.1. General solution of the wave equation | 145 |
| 5.3.2. Taking initial conditions into account. | 147 |
| 5.3.3. Taking into account boundary conditions: image source. | 151 |
| 5.4. Resolution of the wave equation by separation of variables | 154 |
| 5.4.1. General solution of the wave equation in the form of separate variables | 154 |
| 5.4.2. Taking boundary conditions into account. | 157 |
| 5.4.3. Taking initial conditions into account. | 163 |
| 5.4.4. Orthogonality of mode shapes | 165 |

8 Vibration in Continuous Media

| | |
|--|-----|
| 5.5. Applications | 168 |
| 5.5.1. Longitudinal vibrations of a clamped-free beam | 168 |
| 5.5.2. Torsion vibrations of a line of shafts with a reducer | 172 |
| 5.6. Conclusion | 178 |

Chapter 6. Free Bending Vibration of Beams 181

| | |
|---|-----|
| 6.1. Introduction. | 181 |
| 6.2. The problem | 182 |
| 6.3. Solution of the equation of the homogenous beam with a constant cross-section | 184 |
| 6.3.1. Solution. | 184 |
| 6.3.2. Interpretation of the vibratory solution, traveling waves, vanishing waves | 186 |
| 6.4. Propagation in infinite beams | 189 |
| 6.4.1. Introduction | 189 |
| 6.4.2. Propagation of a group of waves | 191 |
| 6.5. Introduction of boundary conditions: vibration modes | 197 |
| 6.5.1. Introduction | 197 |
| 6.5.2. The case of the supported-supported beam. | 197 |
| 6.5.3. The case of the supported-clamped beam. | 201 |
| 6.5.4. The free-free beam | 206 |
| 6.5.5. Summary table | 209 |
| 6.6. Stress-displacement connection | 210 |
| 6.7. Influence of secondary effects. | 211 |
| 6.7.1. Influence of rotational inertia | 212 |
| 6.7.2. Influence of transverse shearing | 215 |
| 6.7.3. Taking into account shearing and rotational inertia | 221 |
| 6.8. Conclusion | 227 |

Chapter 7. Bending Vibration of Plates. 229

| | |
|---|-----|
| 7.1. Introduction. | 229 |
| 7.2. Posing the problem: writing down boundary conditions | 230 |
| 7.3. Solution of the equation of motion by separation of variables | 234 |
| 7.3.1. Separation of the space and time variables | 234 |
| 7.3.2. Solution of the equation of motion by separation of space variables | 235 |
| 7.3.3. Solution of the equation of motion (second method) | 237 |
| 7.4. Vibration modes of plates supported at two opposite edges | 239 |
| 7.4.1. General case | 239 |
| 7.4.2. Plate supported at its four edges | 241 |
| 7.4.3. Physical interpretation of the vibration modes. | 244 |

| | |
|---|------------|
| 7.4.4. The particular case of square plates | 248 |
| 7.4.5. Second method of calculation | 251 |
| 7.5. Vibration modes of rectangular plates: approximation by the edge effect method. | 254 |
| 7.5.1. General issues | 254 |
| 7.5.2. Formulation of the method | 255 |
| 7.5.3. The plate clamped at its four edges | 259 |
| 7.5.4. Another type of boundary conditions | 261 |
| 7.5.5. Approximation of the mode shapes | 263 |
| 7.6. Calculation of the free vibratory response following the application of initial conditions | 263 |
| 7.7. Circular plates | 265 |
| 7.7.1. Equation of motion and solution by separation of variables | 265 |
| 7.7.2. Vibration modes of the full circular plate clamped at the edge | 272 |
| 7.7.3. Modal system of a ring-shaped plate | 276 |
| 7.8. Conclusion | 277 |
| | |
| Chapter 8. Introduction to Damping: Example of the Wave Equation | 279 |
| 8.1. Introduction. | 279 |
| 8.2. Wave equation with viscous damping | 281 |
| 8.3. Damping by dissipative boundary conditions. | 287 |
| 8.3.1. Presentation of the problem. | 287 |
| 8.3.2. Solution of the problem | 288 |
| 8.3.3. Calculation of the vibratory response | 294 |
| 8.4. Viscoelastic beam | 297 |
| 8.5. Properties of orthogonality of damped systems. | 303 |
| 8.6. Conclusion | 308 |
| | |
| Chapter 9. Calculation of Forced Vibrations by Modal Expansion | 309 |
| 9.1. Objective of the chapter | 309 |
| 9.2. Stages of the calculation of response by modal decomposition | 310 |
| 9.2.1. Reference example | 310 |
| 9.2.2. Overview. | 317 |
| 9.2.3. Taking damping into account. | 321 |
| 9.3. Examples of calculation of generalized mass and stiffness | 322 |
| 9.3.1. Homogenous, isotropic beam in pure bending | 322 |
| 9.3.2. Isotropic homogenous beam in pure bending with a rotational inertia effect. | 323 |
| 9.4. Solution of the modal equation | 324 |
| 9.4.1. Solution of the modal equation for a harmonic excitation | 324 |
| 9.4.2. Solution of the modal equation for an impulse excitation | 330 |

10 Vibration in Continuous Media

| | |
|---|-----|
| 9.4.3. Unspecified excitation, solution in frequency domain. | 332 |
| 9.4.4. Unspecified excitation, solution in time domain. | 333 |
| 9.5. Example response calculation | 336 |
| 9.5.1. Response of a bending beam excited by a harmonic force. | 336 |
| 9.5.2. Response of a beam in longitudinal vibration excited by an impulse force (time domain calculation) | 340 |
| 9.5.3. Response of a beam in longitudinal vibrations subjected to an impulse force (frequency domain calculation). | 343 |
| 9.6. Convergence of modal series | 347 |
| 9.6.1. Convergence of modal series in the case of harmonic excitations . . | 347 |
| 9.6.2. Acceleration of the convergence of modal series of forced harmonic responses. | 350 |
| 9.7. Conclusion | 353 |

Chapter 10. Calculation of Forced Vibrations by Forced Wave

| | |
|---|------------|
| Decomposition | 355 |
| 10.1. Introduction | 355 |
| 10.2. Introduction to the method on the example of a beam in torsion. | 356 |
| 10.2.1. Example: homogenous beam in torsion | 356 |
| 10.2.2. Forced waves | 358 |
| 10.2.3. Calculation of the forced response | 359 |
| 10.2.4. Heterogenous beam. | 361 |
| 10.2.5. Excitation by imposed displacement. | 363 |
| 10.3. Resolution of the problems of bending | 365 |
| 10.3.1. Example of an excitation by force | 365 |
| 10.3.2. Excitation by torque | 368 |
| 10.4. Damped media (case of the longitudinal vibrations of beams). | 369 |
| 10.4.1. Example. | 369 |
| 10.5. Generalization: distributed excitations and non-harmonic excitations . | 371 |
| 10.5.1. Distributed excitations | 371 |
| 10.5.2. Non-harmonic excitations | 375 |
| 10.5.3. Unspecified homogenous mono-dimensional medium | 377 |
| 10.6 Forced vibrations of rectangular plates | 379 |
| 10.7. Conclusion | 385 |

Chapter 11. The Rayleigh-Ritz Method based on Reissner's Functional . . .

| | |
|--|-----|
| 11.1. Introduction | 387 |
| 11.2. Variational formulation of the vibrations of bending of beams. | 388 |
| 11.3. Generation of functional spaces | 391 |
| 11.4. Approximation of the vibratory response | 392 |
| 11.5. Formulation of the method | 392 |

| | |
|--|------------|
| 11.6. Application to the vibrations of a clamped-free beam | 397 |
| 11.6.1. Construction of a polynomial base | 397 |
| 11.6.2. Modeling with one degree of freedom | 399 |
| 11.6.3. Model with two degrees of freedom | 402 |
| 11.6.4. Model with one degree of freedom verifying the displacement and stress boundary conditions. | 404 |
| 11.7. Conclusion | 406 |
| | |
| Chapter 12. The Rayleigh-Ritz Method based on Hamilton's Functional . . | 409 |
| 12.1. Introduction | 409 |
| 12.2. Reference example: bending vibrations of beams | 409 |
| 12.2.1 Hamilton's variational formulation | 409 |
| 12.2.2. Formulation of the Rayleigh-Ritz method. | 411 |
| 12.2.3. Application: use of a polynomial base for the clamped-free beam | 414 |
| 12.3. Functional base of the finite elements type: application to longitudinal vibrations of beams | 415 |
| 12.4. Functional base of the modal type: application to plates equipped with heterogenities | 420 |
| 12.5. Elastic boundary conditions | 423 |
| 12.5.1. Introduction | 423 |
| 12.5.2. The problem | 423 |
| 12.5.3. Approximation with two terms | 424 |
| 12.6. Convergence of the Rayleigh-Ritz method | 426 |
| 12.6.1. Introduction | 426 |
| 12.6.2. The Rayleigh quotient | 426 |
| 12.6.3. Introduction to the modal system as an extremum of the Rayleigh quotient. | 428 |
| 12.6.4. Approximation of the normal angular frequencies by the Rayleigh quotient or the Rayleigh-Ritz method. | 431 |
| 12.7. Conclusion | 432 |
| | |
| Bibliography and Further Reading | 435 |
