Preface	xiii
Chapter 1. Humid Air Water Cooling Towers	1
1.1. Properties of humid air	1
1.1.1. Absolute humidity and relative humidity	1
1.1.2. Enthalpy of humid air	2
1.1.3. Density of humid air	3
1.1.4. Vapor pressure of water	5
1.1.5. Transfer coefficients and Lewis number	5
1.1.6. Wet-bulb thermometer equation	7
1.2. Mollier diagram	8
1.3. Measurement of the humid temperature	11
1.3.1. Wet-bulb thermometer and psychrometer	11
1.4. The cooling tower	13
1.4.1. Description of the tower	13
1.4.2. Calculation of the tower	14
1.4.3. Cross-current tower.	19
1.4.4. White plume of air exiting the tower (in winter)	20
1.4.5. Natural-draft tower	20
Chapter 2. Adsorption and Ion-exchange Chromatography	23
2.1. General	23
2.1.1. Adsorption of a gaseous impurity	23
2.1.2. The different ways of working in chromatography	24
2.1.3. Frontal analysis	25

2.1.4. Development by elution (with the initial solvent)	27
2.1.5. Development by displacement (“pushing”).	27
2.2. Modes of feeding an adsorption column	29
2.2.1. Rectangular injection – brief injection	29
2.2.2. Step feed	30
2.3. Transfer parameters	30
2.3.1. Axial dispersivity of the fluid phase	30
2.3.2. Transfer coefficient for fluid–solid material transfer	32
2.3.3. (Balance) equation for the fluid	34
2.3.4. Initial conditions and boundary conditions	36
2.4. Height equivalent to a theoretical plate	37
2.4.1. Graphical determination of t_R , the standard deviation σ and the parameter k'	37
2.4.2. Concept of capacity parameter	38
2.4.3. Height equivalent to a theoretical plate	40
2.4.4. Height equivalent to a theoretical plate	42
2.4.5. Glueckauf’s calculation for the number of theoretical plates	43
2.5. Ideal system and material balance	45
2.5.1. Quasi-ideal system	46
2.5.2. Constant concentration lines in the fluid	47
2.5.3. Material balance with two terms (quasi-ideal system)	48
2.5.4. Sillén’s law	49
2.5.5. Consequence of Sillén’s law	50
2.6. Analytical solutions	52
2.6.1. Rosen’s solution for a step feed in a column	52
2.6.2. Linear isotherm. Step injection	54
2.6.3. Ion exchange where the ions have the same valence	57
2.6.4. Coefficient of reaction kinetics	58
2.6.5. Calculation of the constant concentration profile	59
2.6.6. Villermaux and Van Swaaij’s bell curve for a brief injection	62
2.7. Channeling of a single solute	64
2.7.1. Injection of any form. Abscissa of the discontinuity	64

2.7.2. Propagation of a rectangular pulse. Quasi-ideal system	65
2.7.3. Propagation of a discontinuity in concentration	67
2.7.4. Shape of the profile of q as a function of time (single solute)	68
2.7.5. Calculation of the elution time of the concentration front	69
2.7.6. Position and breadth of the elution peak	73
2.8. Number of solutes greater than 1	76
2.8.1. Study of a binary mixture	76
2.8.2. Concentration profiles (multiple solutes)	77
2.8.3. Exceptions to the rule	78
2.9. Numerical simulation by orthogonal collocation. Finite-element method	79
2.9.1. Presentation of the problem	79
2.9.2. The finite-element method	80
2.9.3. Orthogonal polynomials	80
2.9.4. Error in serial expansion: collocation nodes	82
2.9.5. Discretization matrix $[A]$	82
2.9.6. Generalization to other discretization matrices	84
2.9.7. Case of any given even-numbered polynomial	84
2.9.8. Integration with respect to time	87
2.10. Other numerical methods	88
2.10.1. Finite-difference method	88
2.10.2. Craig's method	90
2.11. Ion exchange	91
2.11.1. Principle of ion exchange	91
2.11.2. Exchange capacity – units used	91
2.11.3. Weakly-acidic or weakly-basic resins	92
2.11.4. Strongly-acidic or strongly-basic resins	94
2.11.5. Regeneration liquors	95
2.11.6. Partition and selectivity	95
2.11.7. Exchange capacities	97
2.11.8. Exchange of ions of the same valence	99
2.11.9. Coefficient of the reaction kinetics	100
Chapter 3. Practical Data on Adsorption, Ion Exchange and Chromatography	103
3.1. A few characteristics of fluid–solid equilibrium	103
3.1.1. Fluid–solid equilibria	103
3.2. (“Batch”) adsorption from a load	105

3.2.1. Contact adsorption followed by filtration	105
3.3. Definition of an industrial chromatography column	106
3.3.1. Design of the installation	106
3.3.2. Number of theoretical plates	106
3.3.3. Relationship between the number of plates and the HETP	108
3.3.4. Production rate (liquid chromatography)	109
3.3.5. Pressure drop across a fixed bed	110
3.3.6. Adsorption in a fixed bed and breaking time	111
3.4. Practical use of adsorbents	113
3.4.1. Characteristics of charcoal in adsorbents	113
3.4.2. Regeneration of charcoal	113
3.4.3. Necessary precautions: explosion, hot points (charcoal)	113
3.4.4. Corrosion	114
3.4.5. Fixed bed	114
3.4.6. Gas-fluidized mobile bed	115
3.4.7. Activated alumina: fixed bed	115
3.4.8. Fluidized plates (silica)	116
3.4.9. Fixed bed (silica)	117
3.4.10. Zeolites	117
3.4.11. Resins: nature	119
3.4.12. Industrial uses of resins	119
3.4.13. Longevity of resins	119
3.4.14. Implementation of resins	120
3.5. Non-isothermal adsorption	121
3.5.1. A few notations to begin with	121
3.5.2. A proposal for the diffusivity in adsorption in a porous medium	121
3.5.3. Local heat balance in a spherule	124
3.5.4. Heat balance of the fluid	125
3.5.5. Equations of fluid–solid exchanges	127
3.5.6. Intra-corpusele diffusivity	128
3.5.7. Lee and Cummings' empirical method	129
3.6. Particular cases in chromatography	129
3.6.1. Gradient elution	129
3.6.2. Reversed-phase chromatography (RPC)	131
3.6.3. Various questions	131
3.7. Practice of ion exchange	132
3.7.1. Practical regeneration procedures	132
3.7.2. Swelling of resins	133

3.7.3. Various processes and possible combinations	133
3.7.4. Obtaining very pure water by strong demineralization	134
3.7.5. A few applications for ion exchange	135

Chapter 4. Theory of Drying Theory of Imbibition and Drainage. The Phenomenon of Hysteresis 137

4.1. Properties of products	137
4.1.1. What is drying?	137
4.1.2. Phase law	137
4.1.3. Wet crystals	138
4.1.4. Food products	139
4.1.5. Excess latent heat (also called the bond heat)	141
4.1.6. Diffusivity of water in plants	142
4.2. General methods for calculations on dryers	144
4.2.1. Material balance	144
4.2.2. Expression of enthalpies	144
4.2.3. Theoretical heat balance	146
4.2.4. Practical heat balance	147
4.2.5. Hypothesis of uniform temperature of the crystals	147
4.2.6. Material transfer from the solid to the gas	149
4.2.7. Differential balances	150
4.2.8. Evaporation across an elementary surface	152
4.2.9. Wet temperature	153
4.2.10. Calculation for a continuous-flow dryer in the convection regime	156
4.2.11. Drying of crystals and grains (a possible solution)	156
4.2.12. A possible calculation method for continuous-flow dryers	157
4.2.13. Irreducible humidity	158
4.2.14. Enthalpy graph	159
4.2.15. Quick and approximate estimation of a dryer	160
4.2.16. Diffusional drying	161
4.3. Transfer coefficients	162
4.3.1. Heat transfer coefficient	162
4.3.2. Correspondence between surface and volume coefficients	165
4.3.3. Material transfer coefficients. Psychometric coefficient	166
4.4. Capillary pressure (imbibition/drainage)	167
4.4.1. Definition	167

4.4.2. Contact angle	169
4.4.3. The three states of a porous material imbibed with a liquid	170
4.4.4. Capillary pressure and saturation.	171
4.5. Thermodynamics and capillarity	172
4.5.1. Free energy and interfacial area	172
4.5.2. Kelvin equation	173
4.5.3. Consequence: liquid film on a solid surface	175
4.5.4. Equilibrium relation (the gas contains an inert substance)	177
4.6. Adsorption and capillarity	180
4.6.1. Adsorption and capillarity in an inorganic porous substance	180
4.7. Hysteresis	183
4.7.1. Hysteresis. Adsorption and desorption of a gas in an inorganic solid	183
4.7.2. Curvature and pore radius. Hysteresis by contact angle.	184
4.7.3. Hysteresis and the ink-bottle model	185
4.7.4. Hysteresis in biological tissue	187
4.7.5. Hysteresis and capillary condensation (according to [BRO 67, BRO 68]).	188
4.8. Movements of the fluids	192
4.8.1. Biphase flow. Composition of the flow	192
4.8.2. Relative permeabilities.	193
4.8.3. Drying of a rigid, inert, porous medium	197
Chapter 5. Dryers	199
5.1. General	199
5.1.1. The various types of dryers	199
5.1.2. Phases and components	200
5.2. Batch dryers	202
5.2.1. Advantage	202
5.2.2. Vacuum dryer with scraper	202
5.2.3. Fluidized-bed dryer.	202
5.2.4. Drying cupboards	203
5.3. Atomization tower and spherulation tower	204
5.3.1. Principle of the method	204
5.3.2. Spraying systems	205
5.3.3. Design and advantage of towers	207
5.3.4. Calculation for a spherulation column.	213
5.4. Indirect-heating rotary dryer.	216

5.4.1. Description and advantage	216
5.4.2. Preliminary calculations	216
5.5. Pneumatic dryer	217
5.5.1. Description.	217
5.5.2. Simulation in the divergent section	218
5.5.3. Preliminary calculations	219
5.5.4. Thermal calculation	223
5.5.5. Calculation in the tube	225
5.5.6. Superheating of the product.	225
5.5.7. Section of the neck of the Venturi	226
5.5.8. Air inlet to the Venturi.	227
5.5.9. Practical data and use	227
5.5.10. Quick estimation of a device	228
5.6. Cylinder dryers.	229
5.6.1. Principle and description	229
5.6.2. Heat flux density for vaporization	232
5.6.3. Simulation	233
5.7. Fluidized continuous-flow dryer	234
5.7.1. Principle	234
5.8. Drying of porous substances.	235
5.8.1. Definitions	235
5.8.2. Drying of shrinkable products	237
5.8.3. Critical humidity	239
5.8.4. The solid is surrounded by a skin	240
5.8.5. Ceramics—simplified method	240
5.9. Drying in a tunnel kiln	243
5.9.1. Practical disposition	243
5.10. Heat transfer in drum dryers	247
5.10.1. Surface of contact between product and gas	247
5.10.2. Heat transfer coefficient	248
5.10.3. Example of simplified thermal calculation of a bladed dryer	249
5.11. Ancillary installations	251
5.11.1. Dust removal from air	251
5.11.2. Cooling of the product	252
5.12. Choice of dryers	253
5.12.1. Depending on the physical state of the product.	253
5.12.2. Depending on the energy expenditure	254
5.12.3. Depending on the intended fate of the product in the dryer	254
5.12.4. Depending on the hygroscopicity of the product	255

5.12.5. Depending on the flowrate treated	256
5.12.6. Depending on the price.	256
5.12.7. Depending on the inlet temperature of the gas.	256
5.13. A few energy considerations.	256
5.13.1. Thermal recovery by a heat pump	256
5.13.2. Drying with solvent-recovery	258
Appendices	259
Appendix 1. Numerical Integration 4th-order Runge–Kutta Method	261
Appendix 2. A Few Important Identities	263
Bibliography	267
Index	279
