Introduction	xiii
Chapter 1. Theoretical Foundations of Electromagnetism	1
1.1. Elements of the theory of distributions applied to electromagnetism	1
1.1.1. Choosing a presentation of the foundations of electromagnetism	1
1.1.2. Linear modeling of physical laws and Green’s kernels	2
1.1.3. Accounting for the “natural symmetries” of physical laws.	3
1.1.4. Motivation for using the theory of distributions	4
1.1.5. Quick review of the theory of distributions.	5
1.1.6. Application to electromagnetism	9
1.2. Vector analysis review according to the theory of distributions	11
1.2.1. Derivation of discontinuous functions defined on \mathbb{R}	11
1.2.2. Derivative of linear mappings.	12
1.2.3. Derivation of discontinuous functions on a surface in \mathfrak{R}^3	12
1.2.4. Derivation of vector distributions in \mathfrak{R}^3	13
1.2.5. Algebra of the operator ∇	13
1.3. Maxwell’s equations according to the theory of distributions	14
1.3.1. Symmetries and duality in electromagnetism	14
1.3.2. The symmetry laws of distributions in electromagnetism	14
1.3.3. Application to the first couple of Maxwell’s equations.	15
1.3.4. Behavior law of materials by means of the theory of distributions	19
1.3.5. Application to the second couple of Maxwell’s equations	19
1.3.6. Charge density, current density, continuity equations.	20
1.3.7. Integral form of Maxwell’s equations	22
1.4. Conclusion	24

Chapter 2. Full Wave Analysis	25
2.1. Discontinuities in electromagnetism	25
2.1.1. Initial and boundary conditions according to the theory of distributions	25
2.1.2. Electromagnetic images, incident and reflected fields	28
2.1.3. Method of moments for the numerical computation of electromagnetic fields	29
2.2. Potentials in electromagnetism	33
2.2.1. Scalar and vector potentials, duality between electrical and magnetic potentials	33
2.2.2. Lossy propagation equations, the Lorentz gauge	35
2.2.3. Green's kernels for harmonic electromagnetic waves in heterogenous media	39
2.3. Topology of electromagnetic interferences	42
2.3.1. Introduction	42
2.3.2. Topological modeling of electromagnetic interferences	43
2.3.3. Partitioning the electrical network in respect of electromagnetic interferences	45
2.3.4. The tree of electromagnetic interferences and the problem of loops	46
2.4. Conclusion	50
Chapter 3. Electromagnetism in Stratified Media	51
3.1. Electrical and magnetic currents in stratified media	52
3.1.1. Scope of the theory, defining stratified media	52
3.1.2. Integral formulation of the current derivative versus time: general case	53
3.1.3. Integral formula of the current derivative relative to space in the direction of the vector potential	61
3.1.4. Duality between electrical and magnetic currents in lossless media	63
3.2. Straight stratified media	67
3.2.1. Scope	67
3.2.2. Lossy propagation equations and the variational approach.	67
3.2.3. Spectral analysis of the longitudinal field.	71
3.2.4. From Maxwell's equations to transmission line equations.	76
3.2.5. Generalized transmission line matrix equation.	79
3.2.6. Non-existence of the TM and TE modes separately.	81
3.2.7. Electrical (or magnetic) currents	84
3.3. Conclusion	84

Chapter 4. Transmission Line Equations	85
4.1. Straight homogenous dielectric media with lossless conductors.	86
4.1.1. Hypothesis	86
4.1.2. Electrical current formulae in TM mode of propagation.	86
4.1.3. Magnetic current formulae in TE mode of propagation	89
4.1.4. Spectral analysis of electromagnetic fields	89
4.1.5. Modal analysis of electrical current and lineic charge	96
4.1.6. Modal analysis of scalar and vector potentials	101
4.1.7. Transmission line with distributed sources corresponding to a waveguide	103
4.2. TEM mode of wave propagation	104
4.2.1. Defining the TEM mode and the transmission lines.	104
4.2.2. Basic existence condition of a TEM propagation mode	105
4.2.3. Variational numerical computation of the lowest wavelength.	107
4.2.4. Telegrapher's equation for current and electrical charge per unit length.	109
4.2.5. Lorentz condition and telegrapher's equation for vector potentials and scalars in TEM mode.	111
4.2.6. Lineic distribution of electrical charges and the Poisson equation	112
4.2.7. Transmission line equations for lossy dielectrics and lossless conductors	115
4.2.8. Green's kernels and the numerical computation of lineic parameters	117
4.3. Quasi-TEM approximation for lossy conductors and dielectrics.	122
4.3.1. Foucault's modal currents of electromagnetic field propagation in lossy media	122
4.3.2. Quasi-TEM approximation of coupled lossy transmission lines.	124
4.4. Weakly bent transmission lines in the quasi-TEM approximation.	126
4.4.1. Bent lossy heterogenous media with lossless conductors.	126
4.4.2. Bent lossy homogenous media with lossless conductors.	127
4.4.3. Bent lossless conductors such that ϵ_n does not depend on q_l , and ϵ_l and C_H do not depend on q_n	128
4.4.4. Lineic capacitance tied to a weak curvature of a transmission line	128
4.5. Conclusion	130
Chapter 5. Direct Time-domain Methods	131
5.1. "Direct" methods in the time domain.	132
5.1.1. Defining a "direct" method in the time domain	132

5.1.2. Single lossless transmission lines in homogenous media	132
5.2. Lossless coupled transmission lines in homogenous media	143
5.2.1. Homogenous coupling	143
5.2.2. Heterogenous coupling	150
5.2.3. Bifurcations	151
5.2.4. Complex distributed parameter networks	156
5.2.5. Estimation of the transient state time of signals	159
5.2.6. Numerical computation of the characteristic impedance matrix	161
5.3. Conclusion	162
Chapter 6. Discretization in the Time Domain	163
6.1. Finite difference method in the time domain	163
6.1.1. From full wave analysis to nodal operational matrices	163
6.1.2. Recursive differential transmission line matrix equation of complex networks	167
6.1.3. Estimation of the transient state time	168
6.1.4. Finite difference approximation of differential operators in the time domain	170
6.1.5. Application to lumped quadripole modeling approximation in the time domain	173
6.1.6. Complex distributed and lumped parameter networks approximation	175
6.2. Matrix velocity operator interpolation method	179
6.2.1. Difficulties set by the compounded matrix functions	179
6.2.2. Matrix velocity matrix operator of stratified heterogenous media	181
6.2.3. Matrix velocity operator interpolation method for the matrix drift equation	183
6.3. Conclusion	187
Chapter 7. Frequency Methods	189
7.1. Laplace transform method for lossy transmission lines	190
7.1.1. Transfer matrix in the Laplace domain	190
7.1.2. Transfer impedance matrix, impedance matching, scattering matrix	198
7.2. Coming back in the time domain	202
7.2.1. Inverse Laplace transform for lossy transmission lines	202
7.2.2. Method of the contribution of loops	203
7.2.3. Application to the distortion of a Dirac pulse in lossy media	206
7.2.4. Classical kernel of the convolution methods	207
7.2.5. Diffusion equation and the time-varying “skin depth”	208

7.2.6. Multiple reflections processing	209
7.3. Method of the discrete Fourier transform	210
7.3.1. Fourier transform and the harmonic steady state	210
7.3.2. Discrete Fourier transform and the sampling procedure	211
7.3.3. Application to digital signal processing	213
7.3.4. Bifurcations and complex networks of lossy transmission lines	215
7.4. Conclusion	217
Chapter 8. Time-domain Wavelets	219
8.1. Theoretical introduction	219
8.1.1. Motivation for the time-domain wavelets method	219
8.1.2. General mathematical framework	220
8.1.3. Seed and generator of direct and reverse wavelets family	221
8.2. Application to digital signal propagation	226
8.2.1. Application to lossless guided wave analysis in the time domain	226
8.2.2. Application to the telegrapher's equation	230
8.2.3. Convergence of wavelet expansions, numerical approximation	233
8.3. Conclusion	241
Chapter 9. Applications of the Wavelet Method	243
9.1. Coupled lossy transmission lines in the TEM approximation	243
9.1.1. Wavelets in homogenously coupled lossy transmission lines	243
9.1.2. Multiple reflections into lossy coupled lines	250
9.1.3. Comparative analysis of frequency and wavelets methods	255
9.2. Extension to 3D wavelets and electromagnetic perturbations	256
9.2.1. Basic second-order partial differential equation of electromagnetic waves	256
9.2.2. Obtaining the wavelet generating equation: $Au = \Lambda u$	257
9.2.3. Direct and reverse generators of the wavelet base	258
9.2.4. Spherical seed and wavelets having a zero divergence	260
9.2.5. Modeling electromagnetic perturbations in lossy media	261
9.2.6. Guided propagation in interconnection structures	262
9.3. Conclusion	262
Appendices	263
Appendix A. Physical Data	263
Appendix B. Technological Data	267
Appendix C. Lineic Capacitors	269

x Electromagnetism and Interconnections

Appendix D. Modified Relaxation Method	275
Appendix E. Cylindrical Wavelets	277
Appendix F. Wavelets and Elliptic Operators	281
References	287
Index	291
