

Table of Contents

Introduction	xix
Jean-Michel TANGUY	
Chapter 1. Reminders on the Mechanical Properties of Fluids	1
Jacques GEORGE	
1.1. Laws of conservation, principles and general theorems	1
1.1.1. Mass conservation, continuity equation	1
1.1.1.1. Mass conservation	1
1.1.1.2. Continuity equation	4
1.1.1.3. Incompressible fluid	5
1.1.2. Theorem for the conservation of momentum	5
1.1.2.1. Assessment for the momentum	5
1.1.2.2. Momentum equation	8
1.1.3. Theorem of kinetic energy	9
1.1.3.1. Assessment of kinetic energy	9
1.1.3.2. Generalized Bernoulli theorem	10
1.1.3.3. Kinetic energy equation	11
1.1.4. The first principle of thermodynamics	12
1.1.4.1. Assessment of total energy	12
1.1.4.2. Total energy equation	13
1.2. Enthalpy, rotation, mixing, saturation	13
1.2.1. Assessment of internal energy	13
1.2.2. Assessment of enthalpy	14
1.2.3. Assessment for the total enthalpy	15
1.2.4. Case of a coordinate frame of reference in rotation	16
1.2.5. The case of humid, saturated air	17
1.2.6. Boussinesq's approximation	18

1.2.7. General report on global equations	18
1.2.8. General assessment of local equations	19
1.3. Thermodynamic relations, relations of state and laws of behavior	20
1.3.1. Constituent laws of the Newtonian fluid	20
1.3.2. Navier-Stokes equations	21
1.4. Turbulent flow	26
1.4.1. Reynolds experience	26
1.4.2. Reynolds equations	26
1.4.3. Turbulent kinetic energy equation	27
1.4.4. Properties of turbulent flows	30
1.5. Dynamics of geophysical fluids	30
1.5.1. Geostrophic movement	30
1.5.2. Buys-Ballot's rule	32
1.5.3. Ekman's layer	32
1.5.3.1. Putting into an equation for the horizontal plane	32
1.5.3.2. Ekman's atmospheric layer	33
Chapter 2. 3D Navier-Stokes Equations	35
Véronique DUCROCQ	
2.1. The continuity hypothesis	35
2.2. Lagrangian description/Eulerian description	36
2.3. The continuity equation	37
2.4. The movement quantity assessment equation	38
2.4.1. Pressure force	38
2.4.2. The force of the Earth's gravity	40
2.4.3. The viscosity force	40
2.5. The energy balance equation	41
2.6. The equation of state	41
2.7. Navier-Stokes equations for a fluid in rotation	41
Chapter 3. Models of the Atmosphere	43
Jean COIFFIER	
3.1. Introduction	43
3.2. The various simplifications and corresponding models	44
3.2.1. General form of the equations	44
3.2.2. Water in the atmosphere	46
3.2.3. Traditional approximation and non-hydrostatic equations	46
3.2.4. Hydrostatic hypothesis and primitive equations	48
3.2.5. Primitive equations with the pressure vertical coordinate	49
3.2.6. The equations of the "shallow water" model	52
3.2.7. Equations of the "zero divergence" model	53

3.2.8. System of equations used for weather forecasting	54
3.3. The equations with various systems of coordinates	56
3.3.1. Vector operators with curvilinear coordinates	56
3.3.2. The equations with geographical coordinates	57
3.3.3. The equations with a conformal projection	60
3.4. Some typical conformal projections	61
3.4.1. The polar stereographic projection	61
3.4.2. The Mercator projection	64
3.4.3. The Lambert projection	65
3.5. The operational models	67
3.5.1. Choice of a vertical coordinate	67
3.5.2. A model adapted to the kind of forecast	68
3.6. Bibliography	69
Chapter 4. Hydrogeologic Models	71
Dominique THIÉRY	
4.1. Equation of fluid mechanics	71
4.2. Continuity equation in porous media	72
4.3. Navier-Stokes' equations	74
4.4. Darcy's law	76
4.4.1. First experimental expression	76
4.4.2. General Darcy's law	77
4.4.3. Intrinsic permeability and permeability to water	78
4.4.4. Anisotropy	78
4.4.5. Limits of application of Darcy's law	79
4.4.6. Extension of Darcy's law to unsaturated media	79
4.5. Calculating mass storage from the equations of state	80
4.5.1. Storage term in saturated media	80
4.5.1.1. Practical values for the specific storage coefficient	81
4.5.2. Storage term in an unconfined aquifer	81
4.6. General equation of hydrodynamics in porous media	82
4.6.1. Equation at a point	82
4.6.2. Diffusion equation in a monolayer aquifer	83
4.7. Flows in unsaturated media	84
4.7.1. The law of permeability	85
4.7.2. Law of retention	85
4.7.3. General equation of hydrodynamics in unsaturated media	88
4.7.4. Examples of laws of retention	89
4.7.5. Examples of laws of permeability	89
4.8. Bibliography	91

Chapter 5. Fluvial and Maritime Currentology Models	93
Jean-Michel TANGUY	
5.1. 3D hydrostatic model	99
5.1.1. Constant viscosity model	102
5.1.2. Mixing-length model	102
5.1.2.1. Volume forces and source terms	103
5.1.2.2. Boundary conditions	103
5.1.2.3. Simplifying the models	105
5.2. 2D horizontal model for shallow water	107
5.2.1. Integrating the continuity equation	109
5.2.2. Integrating the momentum	110
5.2.2.1. Time derivative	110
5.2.2.2. Convection terms	110
5.2.2.3. Diffusion terms	111
5.2.2.4. Pressure gradients	112
5.2.2.5. Coriolis force	112
5.2.2.6. Summary of the main points	112
5.2.2.7. Friction laws	114
5.2.2.8. Effect of wind	114
5.2.2.9. Turbulence	115
5.2.3. Boundary conditions for 2D models	115
5.2.3.1. Solid boundary	115
5.2.3.2. Open boundary	115
5.2.4. 2D models derived from the Saint-Venant model	116
5.2.4.1. Diffusive wave model	117
5.2.4.2. 2D kinematic wave	118
5.2.5. Domains of application for 2D models	119
5.3. 1D models of fluvial flows	119
5.3.1. Equations of the 1D model	120
5.3.1.1. Equation for the conservation of mass	121
5.3.1.2. Equation for the conservation of momentum	122
5.3.1.3. Boundary conditions	124
5.3.1.4. 1D branched, network or cell models	126
5.3.1.5. Taking cells into account	129
5.4. Putting 1D models into real time	131
5.4.1. Coupling hydrologic models and hydrodynamic models	131
5.4.2. Model of a diffusive and kinematic wave	134
5.4.2.1. Gravity wave model	136
5.4.2.2. Diffusive wave model	137
5.4.2.3. Kinematic wave model	139
5.4.2.4. A graphical approach: Bachet's rule	140
5.4.2.5. Definition of the different terms in the equation	143
5.4.2.6. Constructing Bachet's rule	144

5.4.2.7. Limitations of this method	145
5.4.2.8. Using Bachel's rule	145
5.4.3. Application domains of 1D models	146
5.4.4. Discharge-discharge model	147
5.4.4.1. Autoregressive model	147
5.4.4.2. Discharge-discharge propagation model	148
5.5. Bibliography	151
Chapter 6. Urban Hydrology Models	155
Bernard CHOCAT	
6.1. Global models and detailed models used in surface flows	156
6.1.1. Rational method: a simple global model	157
6.1.2. Extension of the rational method: isochrone curves method	157
6.1.3. Detailed models	158
6.1.3.1. Modeling of catchment basins	159
6.1.3.2. Modeling of the network	160
6.1.3.3. Pros and cons of detailed models	160
6.1.3.4. Organization of simulation models	160
6.2. Rainfall representation and rainfall-flow transformation	161
6.2.1. Representation of rainfall water	161
6.2.2. Calculating the rainfall-flow transformation	163
6.3. Modeling of the losses into the ground	164
6.3.1. Horton models	166
6.3.1.1. Soil conservation service (SCS) model	169
6.4. Transfer function	169
6.4.1. Isochrone curves method	170
6.4.2. Unit hydrogram method	171
6.4.3. Reservoir models	172
6.4.3.1. Linear reservoir model	174
6.4.3.2. Possible extensions of the model	176
6.5. Modeling of the hydraulic operating conditions of the networks	177
6.5.1. Hydro-dynamic models	178
6.5.1.1. General 1D Barré de Saint-Venant system	178
6.5.1.2. Possible simplifications of the Barré de Saint-Venant model	180
6.5.1.3. Spreading wave model	182
6.5.1.4. Kinematic wave model	184
6.5.2. Conceptual models	184
6.5.2.1. Time-offset model	185
6.5.2.2. Muskingum model	186
6.6. Production and transport of polluting agents	189
6.6.1. Use of constant concentration at the discharge points	190

6.6.2. Unit water concentration which can vary from one rainfall to another	190
6.6.2.1. Servat model	191
6.6.2.2. Type 1 driver and troutman model	191
6.6.2.3. Cedre model	192
6.6.2.4. Calculation organization	192
6.6.3. Fine mechanistic modeling of deposit, discharge, transport and treatment phenomena	193
6.6.3.1. Production of the flows and of the polluting fluxes	193
6.6.3.2. Transfer of the flows and of the polluting fluxes	193
6.6.3.3. Bed exchange models	196
6.6.4. Modeling of the flows on water-ways	199
6.6.5. Mathematical approach	200
6.6.5.1. Simplifying hypotheses: streaming model	200
6.6.5.2. 1D approach	201
6.6.5.3. 2D approach	203
6.7. Conclusion	205
6.8. Bibliography	206
Chapter 7. Tidal Model and Tide Streams	213
Bernard SIMON	
7.1. Tidal coefficient	214
7.2. Non-harmonic methods	215
7.3. Compatibilities	216
7.3.1. High and low waters height compatibilities	216
7.3.2. Hour compatibility, semi-diurnal tide	219
7.3.3. Hour compatibility, non semi-diurnal types	221
7.3.4. Tidal curves	222
7.4. Tidal coefficient	222
7.5. Modeling	223
7.6. Tidal currents	226
7.6.1. Radiational currents due to the climate, seasons and meteorology	226
7.6.2. Gravitational tidal currents	227
7.6.3. Analysis of the measurements	228
7.6.4. Recent evolutions	230
7.6.5. Numerical files	232
Chapter 8. Wave Generation and Coastal Current Models	235
Jean-Michel TANGUY, Jean-Michel LEFÈVRE and Philippe SERGENT	
8.1. Types of swell models	235

8.1.1. Classification of wave models	237
8.1.2. What can be represented by the wave models	239
8.1.2.1. Wave generation	240
8.1.2.2. Propagation from the sea to the shoreline	240
8.1.2.3. Agitating	241
8.1.3. What would be represented by swell models	241
8.2. Spectral approach in high waters	242
8.2.1. Pierson-Moskowitz spectrum	245
8.2.2. JONSWAP spectrum	245
8.3. Wave generation models	246
8.3.1. Second generation of wave models in high waters	252
8.3.1.1. Introduction	252
8.3.1.2. Physical parameters	254
8.3.1.3. Numerical aspects	256
8.3.1.4. Functionalities and configurations	257
8.3.1.5. Operational configurations	257
8.3.1.6. Another simplified HISWA second generation model	258
8.3.2. Wave current interaction: coupling of wave and current codes	259
8.4. Wave propagation models	260
8.4.1. Curve of the orthogonal lines	260
8.4.2. Conservation of the flow between two orthogonal lines	263
8.4.3. Data required in order to carry out the method	264
8.4.4. Specific numerical methods	264
8.4.5. Results provided by the code leading to the analysis process	266
8.5. Agitating models within the harbors	266
8.5.1. Hypotheses	266
8.5.2. Mild slope equation corresponding to the Berkhoff model	267
8.5.3. Boundary conditions	269
8.5.3.1. Reflecting boundary	269
8.5.3.2. Calculation of the incidence angles	270
8.5.3.3. Iterative methods	271
8.5.3.4. Reflection coefficient	272
8.5.3.5. Dissipative layer	274
8.5.3.6. Open boundary	276
8.5.3.7. Integral equation: analytical solution presenting a circular boundary	276
8.5.3.8. Integral equation: analytical solution on an angular domain	277
8.5.3.9. Integral equation: Green function presenting a random boundary	278
8.5.3.10. Radiation conditions: non-reflecting or absorbing boundary conditions	279
8.5.3.11. Dissipative or absorbing layers	280

8.5.4. Dissipation model	281
8.5.4.1. Dissipation due to the breaking of the waves	281
8.5.4.2. Breaking of the waves through the clipping phenomenon	282
8.5.4.3. Breaking of the waves due to the dissipation phenomenon	283
8.5.4.4. Dissipation due to the friction phenomenon on the seabeds	283
8.5.4.5. Dissipation due to the percolation phenomenon within permeable mediums	284
8.5.5. Random waves	292
8.5.5.1. Notion of spectro-angular density	292
8.5.5.2. Transfer function $H(\omega, \theta)$	292
8.5.5.3. Elements dealing with the analysis of the signal	293
8.5.5.4. Spectral density and swell amplitude $S_{\eta\eta}(\omega)$	293
8.5.5.5. Spectral density of the wave amplitude $S_{\eta\eta}(\omega, \theta)$	294
8.5.5.6. Specific height of the real waves	295
8.5.5.7. Other characteristics of the waves	295
8.5.5.8. Incident spectrum	296
8.5.6. Resolution	297
8.5.6.1. Weak integral form	297
8.6. Non-linear wave model: Boussinesq model	298
8.6.1. System to be solved	299
8.6.2. h-s method	300
8.6.2.1. Legendre polynomials	300
8.6.2.2. Mixed polynomial-logarithmic base	301
8.6.2.3. Hyperbolic base – propagation modes	301
8.6.2.4. Hyperbolic base – evanescent modes	301
8.6.3. Linear dispersion	302
8.6.4. Vertical profiles	303
8.6.5. Linear shoaling effect	304
8.6.6. Non-linear analysis	307
8.6.7. Required data	309
8.6.8. Specific numerical methods	309
8.6.8.1. Variational equation	309
8.6.8.2. The Lax-Wendroff scheme	309
8.6.8.3. TVD scheme with a slope limiter	311
8.6.9. Modeling options	312
8.6.9.1. Breaking of the waves	312
8.6.9.2. Analysis of the moving boundary	313
8.6.9.3. Analysis of a boundary with a free exit	314
8.6.9.4. Generation of the incident waves	315

8.6.10. Results provided by the code and analysis	316
8.6.10.1. Deformation of the swell on a trapezoid underwater dike	316
8.6.10.2. Breaking of the wave	317
8.6.10.3. Migration on underwater breaking line	319
8.6.11. Examples of various models	320
8.7. Coastal current models influenced or created by the swell	320
8.8. Bibliography	325
Chapter 9. Solid Transport Models and Evolution of the Seabed	335
Benoît LE GUENNEC and Jean-Michel TANGUY	
9.1. Transport due to the overthrust effect	338
9.1.1. The Meyer-Peter and Müller equations and its derivatives regarding the wide granulometries, or in the case of gravel bed rivers	338
9.1.2. Loading law	342
9.1.3. Slope effect	343
9.2. Total load	344
9.3. Bed forms and roughness	344
9.4. Suspension transport	346
9.4.1. The Bagnold model	353
9.4.1.1. Details	354
9.4.2. Use of the concentration profiles of the MES on a vertical line	356
9.5. Evolution model of movable beds	357
9.6. Conclusion	364
9.7. Bibliography	364
Chapter 10. Oil Spill Models	371
Pierre DANIEL	
10.1. Behavior of hydrocarbons in marine environment	371
10.2. Oil spill drift models	372
10.2.1. Principle	372
10.2.2. Advection	374
10.2.3. Horizontal expansion	374
10.2.4. Other transformation processes	375
10.3. Example: the MOTHY model	375
10.3.1. Principle	375
10.3.2. Modeling of the current	375
10.3.3. Turbulent diffusion	376
10.3.4. Buoyancy	376

10.3.5. Limits of use	377
10.4. Calculation algorithm of the path of polluting particles	378
10.5. Example of a drift prediction map	379
10.6. Bibliography	379
Chapter 11. Conceptual, Empirical and Other Models	381
Christelle ALOT and Florence HABETS	
11.1. Evapotranspiration	382
11.1.1. Introduction	382
11.1.2. Terminology	382
11.1.3. Empirical methods: the Turc equation	383
11.1.4. Analytical methods: the ETP Penman-Monteith equation	384
11.1.5. Estimation of the RET	386
11.1.6. ISBA modeling	387
11.1.7. Measurements	392
11.2. Bibliography	394
Chapter 12. Reservoir Models in Hydrology	397
Patrick FOURMIGUÉ and Patrick ARNAUD	
12.1. Background	397
12.2. Main principles	399
12.3. Mathematical tools	401
12.4. Forecasting	403
12.5. Integration of the spatial information	405
12.6. Modeling limits	406
12.7. Bibliography	406
Chapter 13. Reservoir Models in Hydrogeology	409
Dominique THIÉRY	
13.1. Principles and objectives	409
13.2. Catchment basin	410
13.3. Setting the model up	411
13.4. Data and parameters	412
13.4.1. Required data	412
13.4.2. Hydrologic parameters	412
13.5. Application domains	412
13.5.1. Application examples	413
13.5.2. 1st application example: Wignacourt springs (Malta island)	414
13.5.3. 2nd application example: Voulzie springs (Provins) (Figure 13.6)	415

13.5.4. 3rd application example: piezometer from the CIEH (Ouagadougou, Burkina Faso)	415
13.5.5. 4th application example: piezometer from Saint Martin de Chennetron (Champigny Limestones)	416
13.5.6. 5th application example: simulation of the flows at the outlet of river basins from the Reunion island after some really strong cyclonic rains	417
13.5.7. 6th application example: simulation of the flows of the Isère river in Val d'Isère (altitude 1,850 m) considering the snowmelt effect	418
Chapter 14. Artificial Neural Network Models	419
Anne JOHANNET	
14.1. Neural networks: a rapidly changing domain	420
14.1.1. System theory	420
14.1.2. Information theory	421
14.1.3. Neuromimetics	422
14.2. Neuron and architecture models	422
14.2.1. Formal neuron	422
14.2.2. Two-layer neural network	423
14.2.3. Training	424
14.3. How to take into account the non-linearity	429
14.3.1. Non-linear or adaptive?	430
14.3.2. Static model	431
14.3.3. Dynamical behaviors	432
14.4. Case study: identification of the rainfall-runoff relation of a karst	434
14.4.1. Baget karst	435
14.4.2. Rainfall-runoff relation	436
14.4.3. Consideration of the evapotranspiration phenomenon	437
14.4.4. Response to an impulse	440
14.5. Acknowledgments	441
14.6. Bibliography	441
Chapter 15. Model Coupling	445
Rachid ABABOU, Denis DARTUS and Jean-Michel TANGUY	
15.1. Model coupling	446
15.1.1. Introduction and objectives	446
15.1.1.1. Phenomena studied	446
15.1.1.2. Why should the methods be coupled with each other?	447
15.1.1.3. How is the coupling process done?	448

15.1.2. Coupling types	448
15.1.2.1. Two-directional retroactive coupling versus simple cascade (without any retroaction)	449
15.1.2.2. Localized coupling at the interfaces, versus spatially distributed coupling	449
15.1.2.3. Internal equational coupling, versus external coupling with specialized software	450
15.1.2.4. Summary (coupling rules)	450
15.1.3. Coupling examples	451
15.1.3.1. Example of the Nash cascade	451
15.1.3.2. Example of time cascade in a numerical scheme	453
15.1.3.3. Simple example of internal equational coupling	458
15.1.3.4. Example of internal and retroactive “surface/subsurface” coupling in the BIGFLOW model	459
15.1.3.5. Example of the cascade of hydrologic modules with the marine model	464
15.1.3.6. Example of coupling software: the PALM coupling	466
15.1.4. Detailed example of a coupling process dealing with coastal morpho-dynamics	470
15.1.4.1. Space scales	471
15.1.4.2. Time scales	472
15.1.4.3. Physical processes and numerical models	472
15.1.4.4. Coupling types between calculation and codes	477
15.1.4.5. Advantages and drawbacks of the coupling process	482
15.1.4.6. Conclusion on the coupling dealing with coastal morpho-dynamics	483
15.1.4.7. Practical example of coastal morpho-dynamic	483
15.1.4.8. Description of the algorithms of the VAG-REFONDE-REFLUX-SISYPHE system	484
15.1.4.9. Towards the use of more efficient hydro-dynamics	485
15.2. Bibliography	488
15.2.1. Coastal morpho-dynamics	488
15.2.2. Numerical simulation, water table and groundwater-river coupling	490
15.2.3. Miscellaneous	491
Chapter 16. A Set of Hydrological Models	493
Charles PERRIN, Claude MICHEL and Vasken ANDRÉASSIAN	
16.1. Introduction	493
16.1.1. Development objectives	493
16.1.2. Development mode	493
16.1.3. Main characteristics	494

16.2. Description of the annual GR1A rainfall-runoff model	495
16.2.1. Introduction	495
16.2.2. Mathematical description	496
16.2.3. Parameter	496
16.3. Description of the monthly GR2M rainfall-runoff model	496
16.3.1. Introduction	496
16.3.2. Mathematical description	497
16.3.2.1. Production	497
16.3.2.2. Percolation	498
16.3.2.3. Routing and exchange with the non-atmospheric surroundings	499
16.3.3. Parameters	499
16.4. Description of the daily GR4J rainfall-runoff model	500
16.4.1. Introduction	500
16.4.2. Mathematical description	501
16.4.2.1. Interception	501
16.4.2.2. Yield function	502
16.4.2.3. Percolation	502
16.4.2.4. Unit hydrographs	503
16.4.2.5. Function dealing with the exchange with the non-atmospheric surroundings	504
16.4.2.6. Routing store	504
16.4.2.7. Total flow	505
16.4.3. Parameters	505
16.5. Applications of the models	505
16.6. Conclusions and future work	506
16.7. Bibliography	507
List of Authors	511
Index	515
General Index of Authors	517
Summary of the Other Volumes in the Series	519
