

Table of Contents

Preface	xi
Chapter 1. Optics and Instruments	1
Jean-Pierre GOURE	
1.1. Introduction.	1
1.2. The media and optical communications	2
1.3. Instruments for image capture.	3
1.3.1. Classic image-capture instruments.	3
1.3.2. Seeing even further	3
1.3.3. Seeing and measuring small objects	4
1.3.4. Improving the image	5
1.4. Optics in industrial processes	5
1.4.1. Metrology and production control	5
1.4.2. Process control	7
1.4.3. Transformation of matter and shaping of materials	7
1.5. Optics and the medicine	8
1.6. Research.	9
1.7. The basic components of an instrument	9
1.8. Bibliography	11
Chapter 2. Formation of Images	13
Henri GAGNAIRE	
2.1. Introduction to optics	13
2.2. Study of a centered system under Gaussian conditions	19
2.2.1. Main elements of a centered system	19
2.2.2. Another form of the Lagrange-Helmoltz relation	22
2.2.3. Nodal points	23

2.2.4. Relation between the object and image space focal lengths – optical power	24
2.2.5. Cartesian and Newtonian equations	25
2.2.6. Longitudinal magnification	28
2.2.7. Association of centered systems	29
2.2.8. Spherical refractive surface	31
2.2.9. Lens	32
2.3. General facts about optical instruments	33
2.3.1. Introduction	33
2.3.2. Size of the image	34
2.3.3. Field.	37
2.3.4. Conclusion.	40
2.4. Geometric aberrations.	41
2.4.1. Introduction	41
2.4.2. Relation between wavefront aberrations and transverse ray aberrations	42
2.4.3. The different types of aberration	44
2.4.4. Seidel aberrations.	46
2.4.5. Conclusion.	55
2.5. Chromatic aberrations.	56
2.5.1. Introduction	56
2.5.2. Some definitions	57
2.5.3. Apparent achromatism of doublets.	59
2.6. Conclusion	60
2.7. Bibliography	61
Chapter 3. A Revision of Photometry and Radiometry	63
Jean-Louis MEYZONNETTE	
3.1. Introduction: the role of photometry and radiometry	63
3.2. The main values of an optical radiation	64
3.2.1. Flux (F).	64
3.2.2. Solid angle (Ω)	65
3.2.3. Intensity (I)	67
3.2.4. Geometric extent (G).	68
3.2.5. Radiance (L), exitance (M)	69
3.2.6. Irradiance E	70
3.2.7. Spectrum	71
3.2.8. Radiometric units	72
3.3. Relations between radiometric parameters of a radiation	73
3.3.1. General relations between geometric parameters	73
3.3.2. Particular case of radiations with uniform radiance.	76
3.3.3. Relations between energetic, photonic and visual parameters.	80

3.4. Some photometric properties of optical instruments	84
3.4.1. Conservation of the geometric extent of a beam in an optical medium and its transfer by an optical interface	84
3.4.2. Effects of refraction and reflection on radiance	85
3.4.3. A revision of instrumental optics	86
3.4.4. Photometry of an imaging system	90
3.4.5. Photometry of a “flux collector” instrument	92
3.5. Bibliography	93
Chapter 4. Light Sources for Optical Instruments	95
Jean-Pierre GOURE and Isabelle VERRIER	
4.1. Generalities about sources	95
4.2. Emission light	96
4.2.1. Coherence of sources	96
4.2.2. Sources characteristics	98
4.2.3. Different types of sources	99
4.3. Lamps	100
4.3.1. Incandescent lamps	100
4.3.2. Halogen lamps	102
4.3.3. Luminescent discharge sources	103
4.4. Lasers	109
4.4.1. Definition and general characteristics	109
4.4.2. Gas lasers	118
4.4.3. Solid-state lasers	120
4.4.4. Optical parametric oscillators	122
4.4.5. Fiber lasers	123
4.5. Diodes	127
4.5.1. Light-emitting diodes	127
4.5.2. Laser diodes	132
4.6. Remote sources and optical power supply	135
4.7. Bibliography	135
Chapter 5. Colorimetry	137
Eric DINET	
5.1. Introduction	137
5.2. Color and the observer	139
5.2.1. The physical stimulus	140
5.2.2. The human visual system	143
5.3. The foundation of colorimetry	148
5.3.1. Tristimulus values	152
5.3.2. Chromaticity diagram	153
5.4. Perception of color differences	155

5.4.1. CIE 1976 $L^*u^*v^*$ color space	157
5.4.2. CIE 1976 $L^*a^*b^*$ color space	157
5.4.3. The problem of dark colors	158
5.5. Evaluation of color differences	159
5.5.1. Color deviation equations based on CIE 1976 color spaces	160
5.5.2. Notes about CIE 1976 color spaces	161
5.5.3. CMC (l:c) color formula.	162
5.5.4. CIE 1994 formula.	163
5.5.5. CIE DE2000 total color deviation formula	164
5.6. Interpreting color deviations and color tolerancing	166
5.7. Conclusion	168
5.8. Bibliography	169
Chapter 6. Bases for Image Analysis	173
Michel JOURLIN	
6.1. Introduction.	174
6.1.1. What is an image?	174
6.1.2. Digitization of the spatial support	176
6.1.3. Digitization of gray scale	179
6.2. Classification of the image.	180
6.2.1. Earliest tools for classification: thresholding, multi-thresholding, contour detection	180
6.2.2. Perspectives towards more complex tools	191
6.3. Interpretation of binary images	192
6.3.1. Measurements	193
6.3.2. Parameters of shape	197
6.3.3. Binary mathematical morphology	198
6.3.4. Correction of a squared grid	204
6.4. Gray level mathematical morphology	207
6.5. An example of a non-linear model: the LIP (Logarithmic Image Processing) model [JOU 01].	208
6.5.1. Initial physical framework	208
6.6. Conclusion	210
6.7. Bibliography	212
Chapter 7. Optics for Imaging: Definition, Manufacturing, Applications	215
G�rard CORBASSON, Jacques DEBIZE and Thierry LEPINE	
7.1. Lenses for photography.	215
7.1.1. Fixed focal length lenses	217
7.1.2. Zoom lenses	222
7.2. Lenses for cinema and television	223

7.2.1. Cinema	223
7.2.2. Television	226
7.2.3. Manufacture	229
7.3. Optics in astronomy	230
7.4. Bibliography	233
Chapter 8. Optics for Images at Low Light Levels.	235
Joël ROLLIN	
8.1. Introduction.	235
8.1.1. Active imagery	236
8.1.2. Low light level passive imagery	236
8.1.3. Infrared thermography	238
8.2. Light intensification devices.	243
8.2.1. Different sensor technologies: light intensification tubes	243
8.2.2. Different sensors: video-compatible solutions	244
8.2.3. Optics for LLL systems	246
8.3. A case apart: the SWIR band	255
8.3.1. The interest of the SWIR band	255
8.3.2. SWIR sensors	256
8.3.3. Optics for the SWIR band.	256
8.4. The 3-5 μm and 8-12 μm bands.	257
8.4.1. The different types of sensors and the design constraints relating to optics	257
8.4.2. Optical materials in the IR band	261
8.4.3. Rather special optical components.	264
8.5. The future.	265
Chapter 9. From the Classic Microscope to the Tunnel Effect Microscope	267
Michel SPAJER	
9.1. Introduction.	267
9.2. Towards the limit of resolution. Aspects of the formation of images	268
9.2.1. Transfer function	268
9.2.2. Transfer function in coherent illumination	271
9.2.3. Aberrations	272
9.2.4. Transfer function in partially coherent illumination	273
9.2.5. Transfer function in incoherent illumination.	275
9.2.6. Structured illumination, synthetic pupil.	277
9.3. The confocal microscope.	278
9.3.1. Coherent confocal microscope	279
9.3.2. Incoherent confocal microscope (fluorescence)	280

9.3.3. 4Pi synthetic aperture	282
9.3.4. Stimulated emission depletion (STED) confocal microscope	283
9.4. Adaptive optics.	284
9.5. Polarized light	285
9.6. Phase microscopies	286
9.6.1. Absolute interferometric phase-shifting measurements	287
9.6.2. Measurements based on a single interferogram	289
9.6.3. 3D holographic microscopy.	290
9.7. Confined light microscopy techniques. Evanescent waves	291
9.8. Near-field local probe microscopy	292
9.9. Bibliography	293
9.10. Glossary of terms used	295
List of Authors	297
Index	299
