Preface	ix
Introduction: Background and Area of Application	xi
Chapter 1. Introduction to Electrostatic Kinetic Energy Harvesting	1
Chapter 2. Capacitive Transducers	7
2.1. Presentation of capacitive transducers	7
2.2. Electrical operation of a variable capacitor	11
2.3. Energy and force in capacitive transducers	12
2.3.1. Energy of a capacitor	12
2.3.2. Force of the capacitor	14
2.3.3. Capacitive transducers biased by an electret layer	17
2.4. Energy conversion with a capacitive transducer	20
2.5. Optimization of the operation of a capacitive transducer	21
2.6. Electromechanical coupling	23
2.7. Conclusions	24
2.8. Appendix: proof of formula [2.32] for the energy converted in a cycle	24
Chapter 3. Mechanical Aspects of Kinetic Energy Harvesters: Linear Resonators	27
3.1. Overview of mechanical forces and the resonator model	27
3.1.1. Linear resonator as the main model of the mechanical part	27
3.1.2. The nature and effect of the transducer force	30
3.1.3. Remarks on mechanical forces	33
3.2. Interaction of the harvester with the environment	36

3.2.1. Power balance of KEHs	36
3.2.2. Efficiency of KEHs	40
3.3. Natural dynamics of the linear resonator	42
3.3.1. Behavior of the resonator with no input	42
3.3.2. Energy relation for the resonator with no input	44
3.3.3. Forced oscillator and linear resonance	45
3.3.4. Periodic external vibrations	49
3.3.5. Energy relation for a forced resonator	50
3.4. The mechanical impedance	52
3.5. Concluding remarks	54
Chapter 4. Mechanical Aspects of Kinetic Energy Harvesters: Nonlinear Resonators	55
4.1. Nonlinear resonators with mechanically induced nonlinearities	55
4.1.1. Equation of the nonlinear resonator	55
4.1.2. Free oscillations of nonlinear resonator: qualitative description using potential wells	60
4.1.3. Free oscillations of nonlinear resonator: semi-analytical approach	62
4.1.4. Forced nonlinear resonator and nonlinear resonance	63
4.2. Review of other nonlinearities affecting the dynamics of the resonator: impact, velocity and frequency amplification and electrical softening	68
4.3. Concluding remarks: effectiveness of linear and nonlinear resonators	71
Chapter 5. Fundamental Effects of Nonlinearity	75
5.1. Fundamental nonlinear effects: anisochronous and anharmonic oscillations	75
5.2. Semi-analytical techniques for nonlinear resonators	79
5.2.1. Normalized form of nonlinear resonators	79
5.2.2. Anharmonic oscillations demonstrated by straightforward expansion	81
5.2.3. Anisochronous oscillations demonstrated by the LPM	84
5.2.4. Multiple scales method	88
5.2.5. Nonlinearity of a general form	91
5.3. Concluding remarks	95
Chapter 6. Nonlinear Resonance and its Application to Electrostatic Kinetic Energy Harvesters	97
6.1. Forced nonlinear resonator and nonlinear resonance	97
6.1.1. Analysis of forced oscillations using the multiple scales method	97
6.1.2. Forced oscillations with a general form of nonlinear force	102

6.2. Electromechanical analysis of an electrostatic kinetic energy harvester	105
6.2.1. Statement of the problem	105
6.2.2. Mathematical model of the constant charge circuit	106
6.2.3. Steady-state nonlinear oscillations	109
6.2.4. Dynamical effects and bifurcation behavior	113
6.2.5. Other conditioning circuits	115
6.3. Concluding remarks	119
Chapter 7. MEMS Device Engineering for e-KEH	121
7.1. Silicon-based MEMS fabrication technologies	121
7.1.1. Examples of bulk processes	122
7.1.2. Thin-film technology with sacrificial layer	123
7.2. Typical designs for the electrostatic transducer	124
7.2.1. Capacitive transducers with gap-closing electrode variation	125
7.2.2. Strategies on the stopper's location in gap-closing e-KEH	128
7.2.3. Capacitive transducers with overlapping electrode motion	130
7.3. e-KEHs with an electret layer	133
Chapter 8. Basic Conditioning Circuits for Capacitive Kinetic Energy Harvesters	135
8.1. Introduction	135
8.2. Overview of conditioning circuit for capacitive kinetic energy harvesting	136
8.3. Continuous conditioning circuit: generalities	138
8.3.1. Qualitative discussion on operation of the circuit	139
8.3.2. Analytical model in the electrical domain	140
8.4. Practical study of continuous conditioning circuits	141
8.4.1. Gap-closing transducer	141
8.4.2. Area overlap transducer	145
8.4.3. Simple conditioning circuit with diode rectifiers	148
8.5. Shortcomings of the elementary conditioning circuits: auto-increasing of the biasing	149
8.5.1. Appendix: listing of the Eldo netlist used to obtain the presented plots	152
Chapter 9. Circuits Implementing Triangular QV Cycles	155
9.1. Energy transfer in capacitive circuits	155
9.1.1. Energy exchange between two fixed capacitors	155
9.1.2. Case of a voltage source charging a capacitor	156
9.1.3. Inductive DC-DC converters	157
9.1.4. Use of a variable capacitor	161

9.2. Conditioning circuits implementing triangular QV cycles	163
9.2.1. Constant-voltage conditioning circuit	163
9.2.2. Constant-charge conditioning circuits	165
9.2.3. Analysis of the circuit implementing a constant-charge QV cycle	166
9.2.4. Practical implementation	169
9.3. Circuits implementing triangular QV cycles: conclusion	171
Chapter 10. Circuits Implementing Rectangular QV Cycles, Part I	173
10.1. Study of the rectangular QV cycle	173
10.2. Practical implementation of the charge pump	178
10.2.1. Evolution of the harvested energy	180
10.3. Shortcomings of the single charge pump and required improvements	182
10.3.1. Need for a flyback	182
10.3.2. Auto-increasing of the internal energy	183
10.4. Architectures of the charge pump with flyback	184
10.4.1. Resistive flyback	184
10.4.2. Inductive flyback	185
10.5. Conditioning circuits based on the Bennet's doubler	188
10.5.1. Introduction of the principle	188
10.5.2. Analysis of the Bennet's doubler conditioning circuit	191
10.5.3. Simulation of a Bennet's doubler	199
Chapter 11. Circuits Implementing Rectangular QV Cycles, Part II	203
11.1. Analysis of the half-wave rectifier with a transducer biased by an electret	203
11.2. Analysis of the full-wave diode rectifier with transducer biased by an electret	205
11.3. Dynamic behavior and electromechanical coupling of rectangular QV cycle conditioning circuits	210
11.4. Practical use of conditioning circuits with rectangular QV cycle	215
11.5. Conclusion on conditioning circuits for e-KEHs	216
Bibliography	217
Index	225
