Acknowledgments	xi
Preface	xiii
Introduction	xvii
Part 1. Context	1
Introduction to Part 1	3
Chapter 1. Recap of the Constraints Governing the Design of Antennas for an NFC Device	5
1.1. Normative constraints	6
1.1.1. Uplink from initiator to targets	7
1.1.2. Downlink from targets to initiator	8
1.1.3. “Contactless” standards versus NFC device antennas	10
1.1.4. Technologies	12
1.1.5. “NFC Forum Devices” and “NFC Forum Tags”	12
1.1.6. Modes of communication of an NFC Forum Device	14
1.1.7. Role of an NFC Forum Device	16
1.1.8. Beware of false advertising	17
1.2. Regulatory constraints	17
1.2.1. RF regulations	17
1.3. Constraints on the NFC market	18
1.4. Typological constraints of NFC	19
1.4.1. Application consequences and their direct constraints	20
1.5. Applicational constraints on antenna design	21

Chapter 2. Introduction to and Recap of the Principles Employed in NFC	23
2.1. The physical fundamentals of “contactless” and NFC	23
2.1.1. Phenomenon of propagation and radiation	23
2.1.2. Classification of fields and spatial regions	24
2.1.3. Spatial regions.	24
2.1.4. Far field: $r \gg \lambda/2\pi$ (Fraunhofer zone)	24
2.1.5. Intermediary field: r approximately equal to λ (Fresnel zone)	25
2.1.6. Near field: $r \ll \lambda/2\pi$ (Rayleigh zone) and by essence, the origin of the “NF – Near Field”, and hence NFC	25
2.1.7. Remarks on contactless, RFID and NFC application	25
2.2. The concept of NFC.	27
2.2.1. Biot–Savart law	28
2.2.2. Field H at a point on the axis of a circular antenna	28
2.2.3. Decrease in the field H as a function of “ d ”	31
2.2.4. Field H at a point on the axis of a rectangular antenna	32
Part 2. Methods and Designs for NFC Device Antennas	35
Introduction to Part 2.	37
Chapter 3. “Initiator” Antennas: Detailed Calculations	41
3.1. Introduction.	41
3.1.1. There are initiators and there are initiators	41
3.2. Design of an initiator antenna (without influence from the outside environment)	42
3.2.1. Operating mode	43
3.2.2. Instructive recap	45
3.2.3. Choice of integrated circuit	54
3.2.4. Legislative constraining aspects and EMC pollution	59
3.2.5. EMC filtering	60
3.2.6. Choice of target used and incidence of its $H_{\text{threshold}}$	73
3.2.7. Determining the inductance value of the initiator antenna	75

3.2.8. Simple antenna	82
3.2.9. Matching circuit for the impedance of the antenna	88
3.2.10. Calculating the current in the antenna coil of the initiator	93
3.2.11. Summary and examples	96
3.2.12. Simulations.	98
3.2.13. Value of the field H radiated by the antenna	100
3.2.14. Calculation and value of the working distance	101
3.3. Maximum quality coefficient Q of the initiator antenna	101
3.3.1. Q and cutoff of the field	103
3.3.2. Decrease in the ISO field	106
3.3.3. Measuring Q in the application.	108
3.3.4. Measurement of the bandwidth in the application.	109
3.4. Brief handbook on the process of designing an antenna initiator.	110
Chapter 4. Examples of Applications of Initiator Antennas	113
4.1. Large antennas	113
4.1.1. Communication with a mono-NFC device in “card emulation – battery-assisted” mode.	114
4.1.2. Communication multi-NFC devices in “tag batteryless” mode	114
4.2. Large antenna in mono-device.	115
4.2.1. Mechanical formats of the NFC device targets	115
4.2.2. “Form factors” and sizes of antennas of the targets	115
4.2.3. Application distances required for operation.	116
4.2.4. Estimation of the “loading effects” of the distance or working range	117
4.2.5. Environment (copper, ferrite, battery, etc.)	117
4.2.6. Several measures for illustrating our proposal.	117
4.2.7. H_d field necessary for the NFC device target.	119
4.2.8. H_0 necessary to create at the antenna level of the initiator	120
4.2.9. Power P (in watts)	120
4.2.10. Field H which must be produced by the initiator for a specific	120
4.2.11. Definition of the initiator antenna: format of the “landing area” of the reader (where one puts the target)	121
4.2.12. “System” considerations of the application.	121

4.2.13. Market integrated circuits for direct attack of the antenna	122
4.2.14. Booster amplifiers.	124
4.2.15. Problem of the retro-modulation value	128
4.3. Large antennas in multi-antennas	130
4.3.1. In simultaneous mode (temporarily non-multiplexed)	130
4.3.2. In multiplexed mode temporarily	133
4.4. Large antennas in multi-devices.	135
4.4.1. Conclusions	137
4.5. Other examples of initiator antennas	138
Chapter 5. Antennas for Targets and Tags: Detailed Calculations	141
5.1. Introduction: ... there is a target and target	141
5.2. NFC Forum Tags	141
5.2.1. “Technology Subset”	142
5.3. Introduction to problems of antenna targets/tags	146
5.3.1. Tuning of the targets/tags	146
5.3.2. The inductance L	146
5.4. State-of-the-art of the antenna sizes	154
5.4.1. Sizes of the target antennas	155
5.4.2. Examples of applications of targets with antennas in ISO classes	157
5.5. Technological aspect of the NFC targets and tags	165
5.5.1. Data specific to integrated circuits for usage by NFC targets	165
5.5.2. Data specific to the additional capacities	165
5.5.3. Industrial data specific to antenna technology	165
5.5.4. Technology at stake	166
5.5.5. Estimation of the minimum number of antenna coils of the target to guarantee its remote power supply	171
Chapter 6. Detailed Examples of Designs of Target Antennas	173
6.1. Case of small antennas	173
6.1.1. Examples in classes 4, 5, 6... or close by.	174
6.1.2. Example of design in class 5	175
6.1.3. Example	180
6.1.4. Example of design in class 6	182
6.2. Case of very small antennas	189
6.2.1. Example of design in classes 11, 12, 13.	190

6.3. Case of the large NFC target/tag antennas: format A4	203
6.3.1. NFC bib number antennas for marathon and triathlon runners	203
6.3.2. Technical properties required by the NFC target/tag	204
6.4. Case of very large antennas targets: format A3.	205
6.4.1. Context and technical frame of the large antennas	205
6.4.2. Retained concept	206
6.4.3. Example of network with four antennas	213
6.4.4. Simplification of the equation	216

Chapter 7. The Initiator–Target Couple and Its Couplings

Chapter 7. The Initiator–Target Couple and Its Couplings	233
7.1. Circuits and their couplings	234
7.1.1. Mutual induction and mutual inductance	235
7.1.2. Perfect mutual	237
7.1.3. Non-perfect mutual	238
7.1.4. Coupling coefficient “k”	242
7.2. Tuned circuits coupled by mutual induction	244
7.2.1. Why “almost”?	245
7.2.2. Coupling index “n”	246
7.2.3. In conclusion, an important point	247
7.3. Identical coupled circuits, tuned to the same frequency	248
7.3.1. Transfer function, $A(\omega) = V_2/V_1$, in terms of the voltage of the secondary	250
7.3.2. Transmission coefficient “Kt”	251
7.3.3. In summary	252
7.3.4. Operation in the vicinity of the resonance frequency f_0	255

Chapter 8. The Initiator–Target Couple and the Loading Effect

Chapter 8. The Initiator–Target Couple and the Loading Effect	271
8.1. Loading effect by coupling.	271
8.2. Coupled tuned antennas in terms of the primary current	272
8.2.1. Primary (initiator) non-loaded (no target within the field)	273
8.2.2. Primary (initiator) with a load (presence of target(s) in the field)	274
8.2.3. Value of R2 in view of the environment	277
8.3. Some food for thought	278
8.4. Loading effect	281

8.4.1. Definition and comments	281
8.4.2. Parameters involved in the loading effect.	282
8.4.3. Variation of the working distance and thus of the coupling	285
8.4.4. Magnetic coupling and its consequences	285
8.4.5. Performances required by the initiator: loading effect on the value of the remote power supply to the target.	286
8.4.6. Quality of the emitted magnetic field	287
8.4.7. Examples of coupling coefficients and loading effects	295
8.4.8. “Shunt” circuit in NFC.	302
8.5. Appendix: how do we approach an NFC project?	307
Conclusion	309
Bibliography	317
Index	319
