Contents

Preface xi

Chapter 1. Introduction to Structural Dynamics 1

1.1. Composition of problems relating to dynamic structures 2
1.1.1. Finite element method 4
1.1.2. Modal superposition method 5
1.1.3. Direct integration 6
1.2. Structural optimization 8
1.2.1. Design optimization 9
1.2.2. Shape optimization 9
1.2.3. Topological optimization 10
1.2.4. Definitions and formulation of an optimization problem 12
1.3. Structures with uncertain parameters 13
1.3.1. Monte Carlo simulation 14
1.3.2. Analytic method 15
1.3.3. Stochastic finite element method 15
1.3.4. Fluid logic method 16
1.3.5. Reliability method 17
1.3.6. Reliability optimization 21
1.4. Conclusion 23

Chapter 2. Decoupled Systems 25

2.1. Introduction 25
2.2. Problems with structural dynamics 25
2.2.1. Movement equation 25

2.2.2. Hooke's law . . . 26
2.2.3. Variational formulation . . . 27
2.2.4. Estimation by finite elements . . . 27
2.2.5. Resolution in the frequency domain . . . 28
2.2.6. Solution in the temporal domain . . . 29
2.2.7. Reduction of the model . . . 31
2.3. Acoustic problems . . . 42
2.3.1. Wave equation: formulation pressure . . . 42
2.3.2. Variational formulation . . . 43
2.3.3. Estimation by finite elements . . . 43
2.3.4. Solution in the frequency domain . . . 44
2.3.5. Model fluid reduction . . . 45
2.4. Conclusion . . . 55

Chapter 3. Coupled Systems . . . 57

3.1. Introduction . . . 57
3.2. Mathematical formulation . . . 57
3.2.1. Behavior equations . . . 57
3.2.2. Conditions for fluid–structure coupling . . . 58
3.3. Variational formulation . . . 59
3.4. Estimation by finite elements . . . 59
3.4.1. Estimation of unknown physical values . . . 59
3.4.2. Integration of variational forms . . . 60
3.5. Vibro-acoustic problem . . . 60
3.6. Hydro-elastic problem . . . 61
3.6.1. Calculation of the elementary matrix of the fluid–structure interaction . . . 64
3.6.2. Dynamic study . . . 65
3.7. Reduction of the model . . . 67
3.7.1. Modal superposition method for the paired system . . . 67
3.7.2. Direct calculation . . . 71
3.7.3. Calculation with modal reduction . . . 72
3.7.4. Modal synthesis method for paired systems . . . 74
3.7.5. Direct numerical calculation . . . 81
3.7.6. Numerical calculation with modal superposition . . . 83
3.8. Conclusion . . . 84

Chapter 4. Reliability and Meshless Methods in Mechanics . . . 85

4.1. Introduction to non-networking methods . . . 85
4.2. Moving least squares . . . 88

4.2.1. Properties of MLS form function 94
4.2.2. Base functions 95
4.2.3. Weight functions 96
4.3. Galerkin mesh-free method 98
4.4. Imposition of essential limiting conditions 103
4.4.1. Variational principle modified with Lagrange multipliers 103
4.4.2. Variational principle modified without Lagrange multipliers 104
4.4.3. Variational principle with a charge 105
4.4.4. Connection with meshing of finite elements 106
4.5. Integration in the EFG method 107
4.6. Description of EFG method algorithms 109

Chapter 5. Mechanical Systems with Uncertain Parameters 115

5.1. Introduction 115
5.2. Monte Carlo simulation 116
5.3. Disturbance methods 116
5.3.1. Expansion into a second-order Taylor series 118
5.3.2. Muscolino distortion method 124
5.3.3. Disturbance methods and modal reduction methods 127
5.4. Projection onto polynomial chaos 131
5.4.1. Moments of the response function in frequency 134
5.4.2. Moments of dynamic response 135
5.4.3. Projection onto polynomial chaos with modal reduction 137
5.5. Conclusion 149

Chapter 6. Modal Synthesis Methods and Stochastic Finite Element Methods 151

6.1. Introduction 151
6.2. Linear dynamic problems 152
6.2.1. Equations of motion 152
6.2.2. Solutions in the transient regime 153
6.2.3. Solutions in the harmonic regime 154

6.3. Modal synthesis methods 155
6.3.1. Introduction 155
6.3.2. Sub-structure assembly technique 157
6.3.3. Fixed interface method 158
6.3.4. MacNeal's free interface method 161
6.3.5. Free interface method. 163
6.3.6. Hybrid method 166
6.3.7. Reduction in degrees of freedom of the interface 166
6.4. Stochastic finite element methods 168
6.4.1. Introduction 168
6.4.2. Discretization of random fields 169
6.4.3. Methods of moments 171
6.5. Conclusion 179

Chapter 7. Stochastic Modal Synthesis Methods 181

7.1. Introduction 181
7.2. Taylor series expansion of the modal equations of a stochastic structure. 181
7.2.1. Expression of the mean values and covariances 184
7.3. Muscolino perturbation method 184
7.3.1. Expansion of the modal equations of a stochastic structure. 185
7.4. Stochastic fixed interface method 186
7.4.1. Taylor series expansion. 186
7.5. Stochastic modal synthesis method 191
7.5.1. Introduction 191
7.6. Conclusion 236

Chapter 8. Dynamic Response of a Structure with Uncertain Variables to a Given Excitation 237

8.1. Introduction 237
8.2. Perturbation method 238
8.2.1. Taylor series expansion of the equations of motion 238
8.2.2. Muscolino perturbation method 241
8.3. Stochastic modal synthesis method 242
8.4. Projection onto homogeneous chaos 245
8.5. Coupling modal synthesis methods with projection onto homogeneous chaos 248
8.6. Conclusion 264

Chapter 9. Stochastic Frequency Response Function 265

9.1. Introduction 265
9.2. Calculation of the stochastic frequency response function 266
9.3. Calculation of the stochastic frequency response function with modal synthesis methods 270
9.4. Conclusion 281

Chapter 10. Modal Synthesis Methods and Reliability Optimization Methods 283

10.1. Introduction 283
10.2. Combining modal synthesis and RBDO methods 283
10.3. Conclusion 294

Chapter 11. Stochastic Model of Transmission in a Wind Turbine 295

11.1. Introduction 295
11.2. Modeling the dynamic behavior of the gearing system in a wind turbine 295
11.3. Dynamic response of a two-step gear system in a wind turbine with uncertain variables 296
11.3.1. Dynamic model of a two-step wind turbine transmission 296
11.3.2. Study using the polynomial chaos method 299
11.3.3. Perturbation method study 309
11.3.4. Comparison of the different methods 315
11.4. Conclusion 317

Bibliography 319
