

Table of Contents

Preface	xi
Acknowledgments	xv
Chapter 1. Jean Biarez: His Life and Work	1
Jean-Louis BORDES, Jean-Louis FAVRE and Daniel GRIMM	
1.1. Early years and arrival in Grenoble	1
1.2. From Grenoble to Paris	4
1.3. The major research interests of Jean Biarez	8
1.4. Research and teaching	9
1.5. Conclusion	13
Chapter 2. From Particle to Material Behavior: the Paths Chartered by Jean Biarez.	15
Bernard CAMBOU and Cécile NOUGUIER-LEHON	
2.1. Introduction	15
2.2. The available tools, the variables analyzed and limits of the proposed analyses	16
2.3. Analysis of geometric anisotropy	18
2.4. Analysis of the distribution of contact forces in a granular material	21
2.5. Analysis of local arrays	24
2.6. Particle breakage	27
2.7. Conclusion	32
2.8. Bibliography	32
Chapter 3. Granular Materials in Civil Engineering: Recent Advances in the Physics of Their Mechanical Behavior and Applications to Engineering Works.	35
Etienne FROSSARD	
3.1. Behavior resulting from energy dissipation by friction	37
3.1.1. Introduction	37

3.1.2. Fundamentals	38
3.1.3. Main practical consequences	43
3.1.4. Conclusions	52
3.2. Influence of grain breakage on the behavior of granular materials	53
3.2.1. Introduction to the grain breakage phenomenon	53
3.2.2. Scale effect in shear strength	56
3.3. Practical applications to construction design	63
3.3.1. A new method for rational assessment of rockfill shear strength envelope	63
3.3.2. Incidence of scale effect on rockfill slope stability	65
3.3.3. Scale effects on deformation features	70
3.4. Conclusions.	78
3.5. Bibliography	79
Chapter 4. Waste Rock Behavior at High Pressures: Dimensioning High Waste Rock Dumps	83
Edgar BARD, María EUGENIA ANABALÓN and José CAMPAÑA	
4.1. Introduction.	83
4.2. Development of new laboratory equipment for testing coarse materials	84
4.2.1. Triaxial and oedometric equipment at the IDIEM.	85
4.3. Mining rock waste.	86
4.3.1. In situ grain size distribution	86
4.3.2. Analyzed waste rock	87
4.4. Characterization of mechanical behavior of the waste rock	88
4.4.1. Oedometric tests	88
4.4.2. Triaxial tests	89
4.4.3. Oedometric test results.	90
4.4.4. Triaxial test results	94
4.5. Evolution of density.	102
4.6. Stability analysis and design considerations	104
4.7. Operation considerations	106
4.7.1. Basal drainage system	106
4.7.2. Water management	107
4.7.3. Foundation conditions	107
4.7.4. Effects of rain and snow	108
4.7.5. Effects of in situ leaching on waste rock	108
4.7.6. Designing for closure	109
4.8. Conclusions.	109
4.9. Acknowledgements	110
4.10. Bibliography	110

Chapter 5. Models by Jean Biarez for the Behavior of Clean Sands and Remolded Clays at Large Strains	113
Jean-Louis FAVRE and Mahdia HATTAB	
5.1. Introduction.	113
5.2. Biarez's model for the oedometer test	115
5.3. Perfect plasticity state and critical void ratio	118
5.4. Normally and overconsolidated isotropic loading	122
5.4.1. Analogy between sands and clays	122
5.4.2. Normally consolidated state (ISL)	123
5.4.3. Overconsolidated state (Cs)	124
5.5. The drained triaxial path for sands and clays	126
5.5.1. The reference behavior.	126
5.5.2. The mathematical model.	127
5.6. The undrained triaxial path for sands.	128
5.6.1. Simplified Roscoe formula for undrained consolidated soils	129
5.6.2. Modeling of the maxima under the right M on the plan $q - p'$	130
5.7. Standard behavior for undrained sands.	132
5.7.1. Normalization by the theoretical overconsolidation stress $p'_i C$	132
5.7.2. Perfect plasticity normalization of the curves in the $(q - \varepsilon_1)$ plane and pore pressure variation.	133
5.7.3. Initial stress p'_0 normalization in the $(q - p)$ plane	133
5.8. The triaxial behavior of "lumpy" sands	134
5.8.1. "Lump" sands	134
5.8.2. The Roscoe model applied to lump sands	135
5.8.3. Synthesis of several lump sand behaviors	136
5.9. A new model to analyze the oedometer's path	138
5.9.1. Burland's model	138
5.9.2. Comparison of models and mixed model.	141
5.9.3. Burland's model in $(I_L - \log \sigma'_v)$ Biarez's space	144
5.10. "Destructuration" of clayey sediments	144
5.11. Conclusion	145
5.12. Examples of manuscript notes	147
5.13. Bibliography	149
Chapter 6. The Concept of Effective Stress in Unsaturated Soils.	153
Said TAIBI, Jean-Marie FLEUREAU, Sigit HADIWARDYO, Hanène SOULI and António GOMES CORREIA	
6.1. Introduction.	153
6.2. Microstructural model for unsaturated porous media	160
6.3. Material and methods	164
6.3.1. Material and preparation of samples.	164
6.3.2. Experimental devices and test procedures	165
6.3.3. Normalization of data	170

6.4. Experimental results.	171
6.4.1. Isotropic compression paths.	171
6.4.2. Deviatoric compression paths.	172
6.4.3. Small strain behavior.	173
6.5. Interpretation of results using the effective stress concept	174
6.5.1. Interpretation of large strain triaxial tests.	175
6.5.2. Interpretation of small strain modulus measurements	176
6.6. Conclusions.	177
6.7. Acknowledgements	178
6.8. Bibliography	178
Chapter 7. A Microstructural Model for Soils and Granular Materials . . .	183
Pierre-Yves HICHER	
7.1. Introduction.	183
7.2. The micro-structural model	185
7.2.1. Inter-particle behavior	186
7.2.2. Stress–strain relationship	189
7.2.3. Model parameters.	190
7.3. Results of numerical simulation on Hostun sand.	191
7.3.1. Drained triaxial tests	191
7.3.2. Undrained triaxial tests	195
7.4. Model extension to clayey materials	196
7.4.1. Remolded clays	198
7.4.2. Natural clays.	200
7.5. Unsaturated granular materials	204
7.6. Summary and conclusion.	214
7.7. Bibliography	216
Chapter 8. Modeling Landslides with a Material Instability Criterion . . .	221
Florent PRUNIER, Sylvain LIGNON, Farid LAOUAFA and Félix DARVE	
8.1. Introduction.	221
8.2. Study of the second-order work criterion	223
8.2.1. Analytical study.	223
8.2.2. Physical interpretation	227
8.3. Petacciato landslide modeling	229
8.3.1. Site presentation	229
8.3.2. Description of the model used	231
8.3.3. Landslide computation.	234
8.4. Conclusion	238
8.5. Bibliography	240

Chapter 9. Numerical Modeling: An Efficient Tool for Analyzing the Behavior of Constructions	243
Arezou MODARESSI-FARAHMAND-RAZAVI	
9.1. Notations	243
9.2. Introduction.	247
9.3. Modeling soil behavior	248
9.3.1. Main characteristics of the soil's mechanical behavior.	248
9.3.2. Constitutive models used for computation	253
9.3.3. Simplified model	254
9.3.4. Generalizing the simplified model.	262
9.3.5. Mechanical behavior of non-saturated soil	265
9.3.6. Loading/unloading definition in plasticity	272
9.3.7. Multimechanism model	274
9.4. Parameter identification strategy for the ECP model	275
9.4.1. Classification and identification of the ECP model parameters	276
9.4.2. Directly measurable parameters	279
9.4.3. Parameters that are not directly measurable	288
9.4.4. Parameters defining the initial state	290
9.4.5. Application of parameter identification strategy.	293
9.5. Influence of constitutive behavior on structural response.	299
9.5.1. Retaining walls	299
9.5.2. Vertically loaded piles	304
9.5.3. Earth and rockfill dams	312
9.6. Conclusions.	318
9.7. Acknowledgments.	319
9.8. Appendix	319
9.9. Bibliography	323
Chapter 10. Evaluating Seismic Stability of Embankment Dams	333
Jean-Jacques FRY	
10.1. Introduction	333
10.1.1. A tribute to Jean Biarez	333
10.1.2. Definitions	334
10.2. Observed seismic performance	335
10.2.1. Earthquake performance of gravity dams	335
10.2.2. Earthquake performance of buttress dams	336
10.2.3. Earthquake performance of arch dams.	337
10.2.4. Earthquake performance of hydraulic fills	338
10.2.5. Earthquake performance of tailing dams	339
10.2.6. Earthquake performance of road embankments and levees	339
10.2.7. Earthquake performance of river hydroelectric embankments.	339
10.2.8. Earthquake performance of small earth dams	340

10.2.9. Earthquake performance of large earth dams	342
10.2.10. Earthquake performance of large zoned dams with rockfill	344
10.2.11. Earthquake performance of concrete face rockfill dams	344
10.2.12. Dynamic performance of physical models.	345
10.2.13. Assessment of seismic damage on dams.	345
10.2.14. Major seismic damage of large concrete dams	346
10.2.15. Seismic damage of large embankment dams	347
10.2.16. Delayed or indirect consequences of an earthquake	347
10.3. Method for analyzing seismic risk	348
10.3.1. Seismic classification of dams in France	348
10.4. Evaluation of seismic hazard.	350
10.4.1. Scenarios for dimensioning a particular situation	350
10.4.2. Choice of seismic levels	350
10.4.3. Choice of the seismic characteristics.	351
10.4.4. Choice of accelerographs	352
10.5. Re-evaluation of seismic stability	355
10.5.1. Maximum risk associated with seismic loading: liquefaction	355
10.5.2. A recommended step-by-step methodology	357
10.5.3. Identification.	357
10.5.4. Pseudo-static analysis of stability.	358
10.5.5. Pseudo-static analysis of displacement	358
10.5.6. Analysis of the liquefaction risk	362
10.5.7. Coupled non-linear analysis	365
10.5.8. Analysis of post-seismic stability.	367
10.5.9. Assessment.	367
10.6. Semi-coupled modeling of liquefaction	368
10.6.1. Objectives	368
10.6.2. Constitutive model	368
10.6.3. Failure criterion	369
10.6.4. Shear strain law	370
10.6.5. Volumetric strain law: liquefaction	372
10.6.6. Model implementation	373
10.6.7. Model qualification in the case of the San Fernando Dam failure	373
10.6.8. Model application to fluvial dikes	380
10.7. Bibliography	387
List of Authors	393
Index	395
