

Table of Contents

Foreword	xiii
Preface	xv
Part 1. Earthquakes and Induced Phenomena	1
Chapter 1. Causes of Earthquakes	5
1.1. Tectonic earthquakes	5
1.1.1. First attempts at explanation	5
1.1.2. From continental drift to plate tectonics	9
1.1.3. Seismicity of tectonic origin	20
1.2. Faults	26
1.2.1. Relationship between earthquakes and faults	27
1.2.2. Classification of faults	29
1.2.3. Focal mechanisms	38
1.2.4. Different aspects of rupture	45
1.3. Non-tectonic earthquakes	47
1.3.1. Non-tectonic quakes with natural causes	48
1.3.2. Artificial earthquakes	49
1.3.3. Induced earthquakes	50
Chapter 2. Parameters Used to Define Earthquakes	55
2.1. Elementary theory of elastic rebound	56
2.1.1. Description of the elementary model	56
2.1.2. Energy balance	61
2.1.3. Law of scale	65
2.2. Geometry of the faults	70
2.2.1. Length of fault and length of rupture	70
2.2.2. Well documented examples of fault ruptures	78

2.2.3. Correlations of geometric characteristics of ruptures with moment magnitude	82
2.3. Parametric description of earthquakes	93
2.3.1. Source parameters and effect parameters	93
2.3.2. Different magnitudes	99
Chapter 3. Manifestations of the Seismic Phenomena on the Surface	107
3.1. Deformation of superficial terrains	107
3.1.1. Deformations linked to tectonics	107
3.1.2. Deformations linked to vibratory motions	110
3.2. Seismic waves	114
3.2.1. Different types of seismic waves	114
3.2.2. Ideas on the theory of rays	121
3.2.3. Attenuation of seismic waves	135
3.3. Induced phenomena	143
3.3.1. Soil liquefaction	143
3.3.2. Landslides	148
3.3.3. Tsunamis and seiches	154
3.3.4. Other seismic manifestations	159
Part 2. Strong Ground Motions	161
Chapter 4. Strong Vibratory Motions	165
4.1. Recordings	165
4.1.1. Examples of accelerograms recorded in the near zone	165
4.1.2. Parametric description of the accelerograms	168
4.1.3. The three components of vibratory motion	178
4.2. Attenuation laws of peak values	186
4.2.1. General considerations as regards attenuation laws	186
4.2.2. Examples of attenuation laws for peak values	188
4.2.3. Recommendations for the use of attenuation laws	197
4.3. Directivity effects and site effects	201
4.3.1. Inadequacy of a description based on magnitude and distance	201
4.3.2. Directivity effects	202
4.3.3. Presentation of site effects	210
4.3.4. Causes of site effects	212
Chapter 5. Calculation Models for Strong Vibratory Motions	223
5.1. Orders of magnitude deduced from the basic theory of elastic rebound	223
5.1.1. Limits of the basic theory of elastic rebound for the calculation of motions	223
5.1.2. Model of elastic rebound with multiple ruptures	227

5.1.3. Calculation of the theoretical attenuation laws associated with the model of rebound elasticity with multiple ruptures	229
5.2. Digital source models	232
5.2.1. General considerations pertaining to models of digital simulation of the seismic source	232
5.2.2. Examples of digital simulation of real earthquakes	234
5.3. Practical calculations of the site effects	240
5.3.1. Models of soil behavior	240
5.3.2. Seismic responses of columns of soil	248
5.3.3. Review of the assessment of site effects	267
Part 3. Seismic Hazards	275
Chapter 6. The Spatial and Temporal Distribution of Seismicity	281
6.1. Data available on the spatial and temporal distribution of seismicity	281
6.1.1. Geological data	281
6.1.2. Historical seismicity	283
6.1.3. Archeoseismicity and paleoseismicity	288
6.1.4. Instrumental seismicity	294
6.2. Models of temporal distribution of seismicity	296
6.2.1. Return periods	296
6.2.2. Gutenberg-Richter law	300
6.2.3. Model of a characteristic earthquake	305
6.3. Prediction of earthquakes	307
6.3.1. Seismic precursors	308
6.3.2. Current questions on forecast	309
Chapter 7. Assessment of Seismic Hazard	315
7.1. Methods of assessment of seismic hazard	315
7.1.1. General notes pertaining to different approaches	315
7.1.2. An example of the deterministic method	317
7.1.3. Probabilistic methods	321
7.2. Practices for the evaluation of seismic hazard	326
7.2.1. Normative evaluation and specific evaluation	326
7.2.2. Zoning for the anti-seismic codes	327
7.2.3. Seismic microzoning	330
7.2.4. Orders of magnitude for hazards due to a fault (vibratory motion and surface rupture)	333
7.2.5. Orders of magnitude of vibratory hazard in diffuse seismicity zones	344
7.2.6. Effect of the size of the site on the vibratory hazard in a zone of diffuse seismicity	353

Part 4. Seismic Action	359
Chapter 8. The Seismic Coefficient	365
8.1. The seismic coefficient in past earthquake-resistant codes	365
8.1.1. Notion of seismic coefficient	365
8.1.2. Development of the seismic coefficient.	366
8.2. The seismic coefficient in current earthquake-resistant codes	370
8.2.1. The structure of current earthquake-resistant codes	370
8.2.2. The definition of seismic action and the rules of calculation in current earthquake-resistant codes	371
Chapter 9. The Response Spectrum	375
9.1. The response spectrum of elastic oscillators	375
9.1.1. Response spectrum of elastic oscillators associated with a natural accelerogram.	375
9.1.2. Response spectrum of elastic oscillators that can be used for designing	386
9.2. Introduction to spectral modal analysis of elastic structures	394
9.2.1. Presentation of a simple example to introduce spectral modal analysis	394
9.2.2. Calculation model for the chosen example	398
9.2.3. Non-damped eigenmodes	401
9.2.4. Calculation of the response for the chosen example	407
9.2.5. Calculation of displacements, accelerations and forces for the chosen example	410
9.3. Structural design spectra	418
9.3.1. Reasons for the general consideration of nonlinearities: the behavior coefficient	418
9.3.2. Elastic and inelastic design spectrum	427
Chapter 10. Other Representations of Seismic Action	433
10.1. Natural or synthetic accelerograms	433
10.1.1. Types of analyses for which accelerogram representation is necessary	433
10.1.2. Choice of accelerograms for linear analysis	435
10.1.3. Choice of accelerograms for nonlinear analysis	437
10.2. Random processes	445
10.2.1. Unfiltered white noise	446
10.2.2. Filtered white noise	452
10.2.3. Theorem of general Brownian motion.	456

Part 5. The Effects of Earthquakes on Buildings	467
Chapter 11. Deformation Effects Sustained by Superficial Ground	473
11.1. Effects of irreversible deformations	473
11.1.1. Damage directly due to movements on fault surfaces	473
11.1.2. Damage due to irreversible deformations of the ground in a horizontal direction (other than fault movements)	481
11.1.3. Damage due to irreversible deformation of the ground in a vertical direction (other than fault movements)	487
11.2. Effects of reversible deformation	490
11.2.1. Details of effects due to reversible deformation with respect to those due to irreversible deformations	490
11.2.2. Static or dynamic character of effects due to reversible deformations	492
Chapter 12. Effects of Vibratory Motions	497
12.1. Effects at the structure/subsoil contact	498
12.1.1. Slipping and tilting	498
12.1.2. Rupture of the ground or foundation system	507
12.2. Inertial effects in structures	512
12.2.1. General observations on the inertial effects	512
12.2.2. Damage and destruction patterns due to horizontal inertial effects for concrete structures	513
12.2.3. Damage and destruction patterns due to horizontal inertial effects for steel structures	535
12.2.4. Damage and destruction patterns due to horizontal inertial effects for structures made of masonry or wood	546
12.2.5. Damage patterns due to vertical inertial effect	553
12.2.6. Effects of shocks	556
12.3. Effects on non-structural elements and supported equipment	564
12.3.1. Deformations imposed on non-structural elements	564
12.3.2. Accelerations transmitted to supported equipment	567
Chapter 13. Effects of Induced Phenomena	573
13.1. Effects of naturally induced phenomena	573
13.1.1. Effects of liquefaction	573
13.1.2. Other naturally induced phenomena	575
13.2. Phenomena induced in networks and industrial setups	575
13.2.1. Disruption of the functioning of networks	575
13.2.2. Fires	578
13.2.3. Accidents in industrial facilities	580

Chapter 14. Scales of Macroseismic Intensity	581
14.1. Characterization of the force of earthquakes through assessment of their effects	581
14.1.1. A summary of the history of scales of intensity	581
14.1.2. Description of some scales of intensity	583
14.1.3. Benefits and limitations of the notion of intensity	588
14.2. Numerical correlations using intensities	594
14.2.1. Correlations of intensities with parameters of vibratory motion.	594
14.2.2. Magnitude-intensity relations and attenuation laws of intensity.	598
 Part 6. Seismic Calculations	 603
 Chapter 15. Linear Seismic Calculation	 607
15.1. General observations on linear calculation.	607
15.1.1. General formulation with relation to absolute axes	607
15.1.2. Formulations for block movement of supports	612
15.1.3. Representation of damping	619
15.1.4. Notes on modeling	627
15.2. Modal spectral analysis for block translation of supports	637
15.2.1. Eigenmodes and quantities attached to modes	638
15.2.2. Number of modes to be retained and combination of modal responses.	653
15.2.3. Combination of effects with three components.	667
15.2.4. Some properties of stick models working in shear.	673
15.2.5. Continuous models. Example of a uniform cantilever beam.	685
 Chapter 16. Notions on Soil/Structure Interaction.	 703
16.1. General observations on soil/structure interaction	703
16.1.1. Presentation of the soil/structure interaction phenomena.	703
16.1.2. Kinematic and inertial interaction	709
16.1.3. Radiative (or geometric) damping	713
16.2. Practical consideration of the soil/structure interaction	721
16.2.1. General case	721
16.2.2. Shallow foundations	724
16.2.3. Cases of deep foundations and linear embedded structures	739
16.2.4. Winkler type models	746
 Chapter 17. Overview of Nonlinear Calculations	 767
17.1. General observations on nonlinear calculations.	767
17.1.1. The problem of hypothesis and criteria	767
17.1.2. Methods of giving recognition to nonlinearities	772
17.2. Some examples of nonlinear calculations	781
17.2.1. Tilting of the rigid blocks	781

17.2.2. Basemat uplifts	793
17.2.3. Slipping of massive blocks	800
17.2.4. Plasticization of building structures	808
17.2.5. Nonlinear shock absorbers for bridges.	822
17.2.6. Pipelines going through a fault	827
Part 7. Seismic Prevention Tools	833
Chapter 18. Technical Aspects of Prevention	839
18.1. Tools for learning	839
18.1.1. The analysis of past experience	839
18.1.2. Test methods	844
18.1.3. Calculation methods	856
18.2. Earthquake engineering codes for normal risks	858
18.2.1. Area of application and technical objectives of the codes	858
18.2.2. Current and future earthquake engineering codes	863
18.3. Special earthquake resistant devices	866
18.3.1. Earthquake resistant supports made of sandwiched elastomer layers.	866
18.3.2. Other special earthquake resistant devices	887
18.3.3. Active control	898
18.4. Earthquake engineering practices for special risk.	899
18.4.1. Nuclear power plants and facilities.	900
18.4.2. Chemical, oil and gas plants.	907
18.4.3. Dams	909
18.5. Seismic diagnosis and reinforcement of the existing framework.	913
18.5.1. The different aspects of seismic diagnosis	914
18.5.2. Rehabilitation and reinforcement	928
Bibliography	933
Index	953
