FOREWORD	xi
CHAPTER 1. THE OCEAN IN THE EARTH SYSTEM: EVOLUTION AND REGULATION	1
Philippe BERTRAND	
1.1. The Earth system and its components	1
1.1.1. A system is a set of objects whose limit is arbitrary, but pertinent	1
1.1.2. One system is necessarily built into another.	3
1.1.3. The Earth is a “closed” system	4
1.1.4. The major components of the Earth system	7
1.1.5. What is the biosphere?	8
1.2. The ocean, from its origins	9
1.2.1. Was there an ocean 4.4 billion years ago?	9
1.2.2. The origin of water on Earth (4.5 – 4 billion years ago)	9
1.2.3. The ocean and the end of the “Venus” phase of the Earth’s history (between 4.5 and 4 billion years ago)	10
1.2.4. Why are there oceans on Earth and a “Venus inferno” on Venus?	13
1.2.5. The ocean, cradle of the first living creatures (between 4.4 and 3.5 billion years ago)	16
1.3. The ocean, oxygen and the evolution of life forms	18
1.3.1. The essential characteristics had been selected in the ocean before the Cambrian period, over 540 million years ago	18

1.3.2. How did oxygen accumulate?	21
1.3.3. The first important accumulation of oxygen (around 2.5 billion years ago)	25
1.3.4. A moderate increase in oxygenation (between 2.5 and 0.5 billion years ago)	26
1.3.5. The second important accumulation of oxygen (between 500 and 350 million years ago).	27
1.4. The regulation of the greenhouse effect by the ocean.	29
1.4.1. There is no life without a minimum greenhouse effect	29
1.4.2. The regulation of the greenhouse effect by the ocean.	30
1.5. Oceanic photosynthesis regulates itself on a short timescale	36
1.5.1. When the ocean is deficient in nitrate	38
1.5.2. When the ocean has an excess of nitrate	40
1.5.3. The regulation of the N/P ratio	41
1.6. Conclusion	43
1.6.1. The ocean in the Earth system	43
1.6.2. The anthropogenic disturbance of the Earth system	45
1.6.3. And life among all that?	47
1.7. Acknowledgments	49
1.8. Bibliography.	49
CHAPTER 2. THE OCEAN AND THE CLIMATE SYSTEM	55
Pascale DELECLUSE	
2.1. Introduction	55
2.2. Climate change	55
2.2.1. The report on the findings	56
2.2.2. Interpretation of the observed changes	58
2.2.3. The Earth's radiative equilibrium and greenhouse gases	59
2.2.4. The role of greenhouse gases – GHG.	60
2.2.5. Scenarios and projections.	63
2.3. Physics and dynamics	67
2.3.1. Rotation, Coriolis, geostrophy.	69
2.3.2. An ocean moved by the wind	71
2.3.3. Ekman, spiral, transport, pumping, upwelling and downwelling	71

2.3.4. Interior ocean and western boundary currents	77
2.3.5. An ocean moved by thermohaline fluxes	80
2.3.6. Stratification, mixed layer, thermocline	82
2.3.7. Formation of water masses, convection and subduction	83
2.3.8. Schematization of global circulation: the great conveyor belt	85
2.4. Some key elements for understanding the ocean's role in the climate	88
2.4.1. Typical times	88
2.4.2. Ocean–atmosphere in the tropics	90
2.4.3. Other types of variability	95
2.4.4. Climatic surprises	97
2.5. Some questions for the future	100
2.6. Bibliography	102
CHAPTER 3. OCEAN–ATMOSPHERE INTERACTIONS	105
Laurence EYMARD and Gilles REVERDIN	
3.1. Introduction: what are ocean– atmosphere interactions?	105
3.2. Interface processes and their role in the coupled system	106
3.2.1. Radiative fluxes	107
3.2.2. Turbulent fluxes	109
3.2.3. Water exchanges between the ocean and atmosphere	115
3.2.4. Other exchanges of matter	118
3.2.5. Flux measurement	125
3.3. Examples of energy exchanges	129
3.3.1. Tropical cyclones	129
3.3.2. Surface temperature fronts	132
3.3.3. The interactions close to strong oceanic fronts	134
3.3.4. Marginal ice zones and associated air–sea fluxes	137
3.3.5. The example of the impact of the iron supply from Saharan aerosols	140
3.4. Conclusion	142
3.5. Bibliography	143

CHAPTER 4. MARINE BIOGEOCHEMICAL CYCLES	145
Louis LEGENDRE	
4.1. Introduction: geochemistry, biogeochemistry and marine biogeochemistry	145
4.1.1. Geochemistry and cosmochemistry	145
4.1.2. Biogeochemistry and marine biogeochemistry	147
4.2. A fundamental characteristic of the Earth's system: biogeochemical cycles	149
4.3. Carbon: at the heart of living matter	152
4.3.1. Carbon in large natural reservoirs	153
4.3.2. Biogeochemical cycles of carbon	156
4.4. Oxygen: a poison that Earth cannot do without	166
4.4.1. The Great Oxygenation Event	168
4.4.2. Biogeochemical cycles of oxygen.	169
4.5. Nitrogen: a chemical element over which countries have fought in the past	174
4.5.1. Nitrogen, abundant but difficult to access	174
4.5.2. Biogeochemical cycles of nitrogen	176
4.6. Phosphorus: a chemical element over which countries may fight in future	182
4.6.1. Phosphorus, not very abundant or exploitable.	182
4.6.2. Biogeochemical cycles of phosphorus	182
4.7. Biogeochemical equilibria and human societies: problems.	185
4.8. Bibliography.	186
CHAPTER 5. OCEAN ACIDIFICATION AND ITS CONSEQUENCES	189
Jean-Pierre GATTUSO, Lina HANSSON and Frédéric GAZEAU	
5.1. Introduction	189
5.1.1. What is ocean acidification?	190
5.1.2. A brief history of research on the acidification of oceans	193
5.1.3. Main research programs	197
5.2. Observations.	197
5.2.1. Past changes	197
5.2.2. Recent changes.	199
5.3. Projections	201
5.4. Impacts of ocean acidification	204
5.4.1. Impacts on organisms and communities	204

5.4.2. Impacts on biogeochemical cycles	219
5.4.3. Economy and society	221
5.5. What are the solutions?	225
5.5.1. The reduction of CO ₂ emissions	226
5.5.2. Geoengineering techniques	227
5.5.3. Adaptation measures	228
5.6. Conclusion	229
5.7. Acknowledgments	231
5.8. Appendix	231
5.8.1. Carbonate chemistry of carbonates and biogeochemical processes	231
5.9. Bibliography	233
