PREFACE	ix
INTRODUCTION	x
CHAPTER 1. ELECTROMAGNETIC WAVE SCATTERING FROM RANDOM ROUGH SURFACES: BASICS	1
1.1. Introduction	1
1.2. Generalities	2
1.2.1. Maxwell equations and boundary conditions	2
1.2.2. Propagation of a plane wave (Helmholtz equation and plane wave)	5
1.2.3. Incident wave at an interface: polarization	7
1.3. Random rough surfaces: statistical description and electromagnetic roughness	12
1.3.1. Statistical description of random rough surfaces	12
1.3.2. Specific case of sea surfaces	19
1.3.3. Electromagnetic roughness and Rayleigh roughness criterion	21
1.4. Scattering of electromagnetic waves from rough surfaces: basics	28
1.4.1. Presentation of the problem (2D/3D)	28
1.4.2. Huygens' principle and extinction theorem	30
1.4.3. Green functions (2D/3D)	33
1.4.4. Scattered powers and scattering coefficients	36
CHAPTER 2. DERIVATION OF THE SCATTERED FIELD UNDER ASYMPTOTIC MODELS	41
2.1. Bibliography on existing models	42
2.1.1. Introduction	42
2.1.2. Rigorous models	43
2.1.3. Asymptotic models	44

2.1.4. General properties of scattering	52
2.1.5. A few details on the KA and the GO	55
2.2. Scattering in reflection and transmission under the KA with shadowing effect	58
2.2.1. KA in reflection and transmission with shadowing effect for 2D problems	58
2.2.2. Extension of the KA model to 3D problems	62
2.3. Scattering in reflection for 3D problems under various asymptotic models	69
2.3.1. Context and specific notations	69
2.3.2. The small perturbation model	71
2.3.3. The Kirchhoff approximation–high-frequency regime	73
2.3.4. The weighted curvature approximation	75
2.3.5. The small slope approximation	75
2.3.6. The local curvature approximation	76
2.3.7. The resonant curvature approximation	76
2.3.8. Validation of the different asymptotic numerical models for 2D problems	77
CHAPTER 3. DERIVATION OF THE NORMALIZED RADAR CROSS-SECTION UNDER ASYMPTOTIC MODELS	81
3.1. Derivation of incoherent normalized radar cross-section under the GO for 2D problems	82
3.1.1. Incoherent NRCS under the GO with shadowing effect for 2D problems	82
3.1.2. Calculation of the bistatic shadowing functions in reflection and transmission	86
3.2. General properties and energy conservation of the GO for 2D problems	97
3.2.1. General properties of the GO for 2D problems	97
3.2.2. Study of energy conservation under the GO for 2D problems	99
3.3. Scattering coefficients under the GO with shadowing effect for 3D problems	108
3.4. Energy conservation of the GO model for 3D problems	111
3.4.1. Case of a perfectly conducting lower medium	112
3.4.2. Case of a lossless dielectric lower medium	115
3.5. Scattering in reflection for 3D problems under various asymptotic models	117
3.5.1. Expression of the NRCS under the SPM1	118
3.5.2. Expression of the NRCS under the GO	118
3.5.3. Expression of the NRCS under the SSA	119
3.5.4. Validation and comparison of the different asymptotic analytical models for 2D problems	119

3.5.5. Comparison between numerical and analytical asymptotic models for 3D problems	121
APPENDIX 1. FAR-FIELD SCATTERED FIELDS UNDER THE METHOD OF STATIONARY PHASE	125
APPENDIX 2. CALCULATION OF THE SCATTERING COEFFICIENTS UNDER THE GO FOR 3D PROBLEMS	131
BIBLIOGRAPHY	137
INDEX	149
